HOOS FIELD

41

HOOS FIELD—LEGUMINOUS PLOTS

1848-9 ONWARDS

The small plots (see Plan on page 40) represent portions of the original plots on which attempts have been made to grow leguminous plants continuously since 1848. Various combinations of mineral manures have been used up till 1898, but after the first few years very small crops have been grown, and the clovers in particular generally fail. After fallowing in 1903 to clean the plots, they were resown as before in 1904.

The remainder of the area was formerly occupied by similar small plots of the same leguminous plants. These were ploughed up in 1898, and five crops of wheat were taken without manure in order to test the amount of nitrogen accumulated by the leguminous crop and left in the soil.

In 1904 black tartarian oats were sown, and in the oats, lucerne, red clover, and alsike clover were sown on three strips; a fourth strip, fallowed in 1904, was sown with vetches in October of that year, as shown in the Plan on page 40. The new plots run across the old ones at right angles. The following table shows the crop obtained in 1905 and each year since to 1912 inclusive.

HOOS FIELD—POTATO PLOTS

RESIDUE OF MANURES

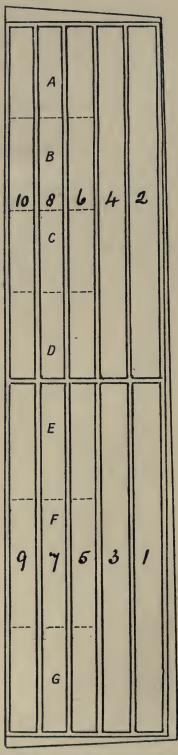

On ten plots potatoes were grown with various manures for 26 years (1876-1901). In 1902 the manuring was discontinued and barley sown. Table XX. shows the yields obtained.

Digitized by Microsult &

G.—Plan of the Plots in Hoos Field on which Potatoes were grown without Manure, and with various Manures.

26 years, 1876-1901.

In 1902 and 1903 Barley, and in 1904 Oats, were sown, without manure, to determine the duration of the residues of the previous manuring In 1905 and each year to 1911 Barley was sown, and in 1912 Oats, on Plots 1-4 without manure. Plots 5-10 sown with Leguminous seeds each year to 1911, and Oats in 1912.

Total area of ploughed land, about $2\frac{1}{10}$ acres. Area of each plot, $\frac{1}{0}$ acre. The double lines indicate division paths between plot and plot.
