NOTES ON THE TABLE

- Except for the last column, all quantities are measured.
- Temperatures were measured in °F.
- 'Soil at 10 cm' and 'Dewpoint' are at 0900 GMT.
- For radiation, 100 calories = 116 mW/h.
- Run of the wind is measured in miles per day, and is used in calculations in this unit.
- 'Standard gauge' is 5 in. diameter and surrounded by a turf wall to meet Meteorological Office specification. Measurements were in inches.
- 'Drainage' is through bare, undisturbed soil: gauge area = 1/1000 acre.
- M.O. tank is 6 ft square, 2 ft deep, water at ground level, and rim projecting 3 in. above.
- Potential transpiration—the only calculated entry—is derived from mean air temperature, dewpoint temperature, sunshine, Kipp record and run-of-the-wind.
- Departures from long-period averages (in brackets) are for different periods:

Air Temperature	1878-1967
Sunshine	1892-1967
Rain	1948-1967
