Rothamsted Experimental Station Report for 1971 Part 2

[Full Table of Content](#)

Rothamsted Insect Survey

L. R. Taylor and R. A. French

L. R. Taylor and R. A. French (1972) *Rothamsted Insect Survey* ; Rothamsted Experimental Station Report For 1971 Part 2, pp 181 - 199 - DOI: <https://doi.org/10.23637/ERADOC-1-37296>

Rothamsted Insect Survey

L. R. TAYLOR and R. A. FRENCH

Suction traps

Weekly bulletins were issued from the week commencing 13 April until the week ending 4 November and the 33 aphid species or groups of species listed were the same as in 1970, with the addition of *Pentatrichopus fragaefolii*.

The 13 sites that appeared in the 1970 bulletins also resumed working in 1971 with one additional site, called Elgin, at the North of Scotland Agricultural Experimental Farm, Aldroughty, Elgin, Inverness-shire. Unfortunately the Zeeland trap, in Holland, ceased to operate on 18 July and its future is not certain. The East Craigs trap, near Edinburgh, burned down on 3 October and will be replaced for 1972.

Samples were collected throughout the year from traps at the Building Research Station, Garston, Hertfordshire, and at Rothamsted Farm. New traps began to work at Den kgl. Veterinaer-og Landbohøjskole, Zoologisk Institut, Copenhagen, Denmark, on 1 July, at the Rosemaund Experimental Husbandry Farm (MAFF), Preston Wynne, Hereford, on 12 July, and a third trap, for standardising the sample, at Rothamsted Farm on 6 September. None of these sites are listed for 1971. A new site will begin to operate at the ADAS Centre at Shardlow Hall, Shardlow, nr, Derby, in 1972 and this, together with those at Copenhagen and Rosemaund, will appear in the 1972 bulletins and tables.

The two midland sites will increase the inland replication necessary to assess the early warning effectiveness of the traps. Results from the ADAS survey of aphid immigration into cereal crops show that the suction traps continue to detect cereal aphids about three weeks before practicable crop sampling (see *Rothamsted Report for 1971*, Part 1).

The extension of the survey into Denmark introduces a new scale of geographical barrier into the area sampled, a sea passage of 500–600 km (300–400 miles) compared with the 100–150 km crossing to Zeeland. It may be that the size and species composition of the aphid sample at the new site will differ considerably from those listed here; there are no data available on which to base expectation.

Sample volumes were halved at Broom's Barn, Rothamsted Tower, Silwood Park and Wye from 25 June to 5 August (weeks 26–31 inclusive) and at all sites from 24 September to 22 October (weeks 39–42 inclusive). Bulletin and Annual Report tables are corrected to full sample volume.

Table 1a–h lists the same 31 aphid taxa as the weekly bulletins, in standard four-week periods beginning at weeks 13–16, 26 March–22 April (Table 1a); first arrivals were about four weeks earlier than in 1970. Traps are arranged in a north to south sequence. Blanks in the table are zero catches. Zeeland is missing from Table 1e onward and Edinburgh from Table 1h; there are no other missing records but the sample from Edinburgh on Table 1g, weeks 37–40, is five days short, i.e. from 10 September to 2 October only.

Light traps

Tables 2a–d give total annual catches during 1969–70 of the same 31 pest or migratory Lepidoptera as in *Rothamsted Report for 1970*, Part 2. Of the 62 sites with a full year's

ROTHAMSTED REPORT FOR 1971, PART 2

sample in 1969, 37 also completed 1970; 31 new sites makes a total of 68 sites in the table. At the end of 1971, 128 traps are operating.

Sites are again arranged in a north to south sequence and the species in the same sequence as before. Zero catches are recorded as 0 and dashes indicate missing records.

Voluntary workers again operated most of the traps and identified many of the insects; for this we are most grateful.
