Rothamsted Insect Survey

Eighth Annual Summary

L. R. TAYLOR and R. A. FRENCH

Suction traps

Samples were collected daily from 1 April to 4 November 1976 and the *Aphid Bulletins* were issued weekly from 5 April (*Bulletin* No. 1) to 31 October (*Bulletin* No. 30). The 33 aphid taxa listed in Table 1(a-h) are those in the *Aphid Bulletin* and are the same as in 1975.

A new trap at Monktonhall, Musselburgh, Midlothian, started operating on 14 June 1976 and the trap at Rainham ceased to operate on 13 June 1976. Traps at 4 ft (1.2 m) were operated at Dundee, East Craigs, Broom's Barn and Rothamsted; records for these do not appear in the *Bulletins* nor in Table 1.

Catches from Zeeland, Broom's Barn and Aberystwyth were mainly identified at the site by D. Hille Ris Lambers of Bladluisonderzoek, G. D. Heathcote of Broom's Barn and A. M. Dewar of the Welsh Plant Breeding Station respectively. The catches from Musselburgh were identified by Miss S. Cooper of DAFFS, East Craigs. H. L. G. Stroyan of MAFF, Plant Pathology Laboratories, and V. F. Eastop of the British Museum (Natural History) confirmed difficult identifications.

The *Bulletin*, despatched each Friday, lists aphids caught between 5 and 12 days earlier, except for Zeeland and Copenhagen where samples were from 12 to 19 days previously. This timing is dictated by the postal service.

The *Bulletins* cover the working week Monday to Sunday. Table 1 is for standard four-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4).

Sample volumes were halved at Rothamsted Tower from 7 June to 13 July, at Shardlow, Long Ashton, Silwood and Starcross from 8 June to 14 July, at Hereford and Writtle from 9 June to 16 July, at Broom's Barn from 9 June to 19 July, at Preston from 10 June to 20 July, at Wye from 14 June to 14 July, at Elgin, Dundee, Newcastle and High Mowthorpe from 29 June to 20 July, at East Craigs from 8 to 19 July and at Musselburgh from 9 to 22 July 1976. There was also subsampling in the laboratory for most sites when numbers were high. Both the weekly *Bulletins* and Table 1(a-h) are corrected to full volume samples.

In Table 1 there are no missing values; a blank records a zero catch.

Light traps

Table 2(a-h) gives the annual catches during 1974 and 1975 of the same pest, or migratory, Lepidoptera as in previous years. One hundred and nine sites completed the 364-day sample for 1975.

The sites in Table 2 are arranged in sequence from north to south and the species are in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

Once again voluntary workers operated most traps and identified many of the insects; for their help we are most grateful.
