Rothamsted Insect Survey

Ninth Annual Summary

L. R. TAYLOR and R. A. FRENCH

Suction traps 1977

Daily samples were collected from 1 April to 4 November 1977 and the *Aphid Bulletins* were issued weekly from 29 April (*Bulletin* No. 1) to 4 November (*Bulletin* No. 28). The 33 aphid taxa listed in Table 1(a-h) and Table 3 are those in the *Aphid Bulletin*.

A new trap at North Farm, Washington, Pulborough, Sussex started on 14 April 1977, and an additional trap in Holland was operating this year at Nagele, Nr Emmeloord, N.E. Polder. The trap at Rainham discontinued in 1976, restarted on a new site, 1 mile from the old site on 4 March 1977. This trap continued to operate throughout the season but due to pressure of work the results did not appear on the *Bulletins* after 24 July. During 1977 a similar trap operated at the Department of Agriculture, Belfast, N. Ireland and appears in Table 3. A new site at Pathead, Dalkeith, Midlothian replaced the one at Musselburgh; this does not appear in Table 1. Traps at 4 ft (1.2 m) were operated at Dundee, East Craigs, Broom's Barn, Rothamsted Tower and North Farm; records for these do not appear in *Bulletins* nor in Table 1.

Catches from Zeeland and Nagele, Broom's Barn and Aberystwyth were identified by A. Van Harten of Wageningen, G. D. Heathcote of Broom's Barn and J. A'Brook of the Welsh Plant Breeding Station respectively. The catches from East Craigs and Pathead were identified by Miss S. Cooper of Department of Agriculture and Fisheries Scotland, East Craigs, H. L. G. Stroyan of Ministry of Agriculture, Fisheries and Food, Plant Pathology Laboratory and V. F. Eastop of the British Museum (Natural History) confirmed difficult identifications.

The *Bulletin*, despatched each Friday, lists aphids caught between 5 and 12 days earlier, except for Zeeland, Nagele and Copenhagen where samples were from 12-19 days previously. This timing is dictated by the postal services.

The *Bulletins* cover the working week Monday to Sunday. Table 1 is for standard 4-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4).

Sample volumes were halved at Rainham and Silwood from 7 July to 25 August, at Writtle from 11 July to 25 August, at Broom's Barn from 28 July to 31 August, at Rothamsted Tower from 2 to 19 August, at Preston and Wye from 17 to 25 August, and Hereford from 17 to 30 August, at Shardlow from 25 to 30 August 1977. When numbers were high catches from most sites were sub-sampled in the laboratory. The weekly *Bulletins*, Table 1(a-h) and Table 3 are corrected to full volume samples.

In Tables 1 and 3 there are no missing values; a blank records a zero catch.

Light traps

Table 2(a-h) gives the annual catches during 1975 and 1976 of the same pest, or migratory, Lepidoptera as in previous years. One hundred and twenty-five sites completed the 364-day sample for 1976.

The sites in Table 2 are arranged in sequence from north to south and the species are in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

Once again voluntary workers operated most traps and identified many of the insects; for their help we are most grateful.

ROTHAMSTED REPORT FOR 1977, PART 2

TABLE
The Rothamsted Insect Survey—Suction Traps: four-weekly total catches
Week Nos. 13 to 16—
