Rothamsted Insect Survey

Fifteenth Annual Summary

L. R. TAYLOR, I. P. WOIWOD, E. D. M. MACAULAY, MAUREEN J. DUPUCH and
JOAN NICKLEN

Suction traps 1983

Daily samples were collected from 5 April to 20 November 1983, except at the (906) Newcastle trap which did not operate until 11 May 1983. *Aphid Bulletins* were issued weekly from 25 April (*Bulletin* No. 1) to 20 November (*Bulletin* No. 30). The 33 aphid taxa listed in Table 1 (a–h) are those in the *Aphid Bulletin*.

Dr L. A. D. Turl and colleagues at the Department of Agriculture and Fisheries for Scotland (DAFS), East Craigs, are now entirely responsible for the operation of suction traps at (916) Elgin, (907) Dundee, (912) East Craigs, (931) Pathhead, (923) Auchincruive, Ayr and also (925) Stirling. The trap at (928) Rainham only operated from 16 February to 15 July; it only appeared on *Bulletins* up to 15 July and in Table 1 (a–d). Due to a blockage in the trap, the catches from (919) Shardlow, from 10 August (approx.) until 10 October 1983, are inaccurate. Suction traps sampling at 5 ft (1.5 m) were operating at (954) East Craigs, (956) Ingraston and (951) Rothamsted Tower; records for these do not appear on *Bulletins* nor in Table 1.

Samples from (911) Aberystwyth were identified by Mr J. A'Brook and Mr H. Evans of the Welsh Plant Breeding Station; Dr G. D. Heathcote of Broom's Barn Experimental Station identified catches from (904) Broom's Barn. The samples from the Scottish traps were identified by Dr L. A. D. Turl, Dr D. A. Cooper, Mr R. Burns and Dr K. Walters of the Department of Agriculture and Fisheries for Scotland, East Craigs. We appreciate their co-operation in providing information for the weekly *Bulletins* and for these tables.

The *Bulletin*, despatched each Friday, lists aphids caught between 5 and 12 days earlier. This timing is dictated by the postal services.

The *Bulletins* cover the working week Monday to Sunday. Table 1 is for standard 4-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4). *Bulletin and standard weeks do not correspond*.

Sample volumes were halved at various sites as follows: (901) Rothamsted Tower from 8 June to 6 September, (928) Rainham 9 June to 15 July, (919) Shardlow, (917) Hereford, (903) Wye and (933) Littlehampton from 9 June to 6 September, (914) Long Ashton from 9 June to 12 September, (922) Preston, (924) Writtle and (908) Silwood from 9 June to 13 September, (904) Broom's Barn from 24 June to 24 July, (905) High Mowthorpe, (934) Kirton and (913) Starcross from 12 July to 6 September. In addition, when numbers were high, catches were sub-sampled in the laboratory to reduce the pressure of work. The weekly *Bulletins* and Table 1 (a–h) are corrected to full volume sample.

In Table 1 (a–h) there are no missing values, a blank records a zero catch.

ROTHAMSTED REPORT FOR 1983, PART 2

Light traps

Table 2 (a–f) gives the annual catches during 1981 and 1982 of the same pest, or migratory Lepidoptera as in previous years.

Eighty-four sites completed the 364-day sample for 1982.

The sites in Table 2 are arranged in sequence from north to south, and the species in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

In addition to the species listed in the Table, there were others of note. Bretherton and Chalmers-Hunt (1983) reported 1982 as being an exceptional year for migrants, and survey sites reflected this. *Rhodometra sacraria*, The Vestal, normally extremely rare, was widespread, appearing mainly in the south and west (27 at site no. 114, Rosewarne in Cornwall; 12 at site no. 266, Yarner Wood in Devon) with one specimen in Scotland at site no. 339, Glentress. *Heliothis peltigera* appeared at two sites, no. 149, Starcross in Devon (1) and no. 339, Glentress in Peeblesshire (1). One specimen of *Palpita unionalis*, found at site no. 16, Stratfield Mortimer in Berkshire on 17 October, was surprising since none were found at other sites in the main waves of migrants. Site no. 114, Rosewarne, also caught three specimens of *Laphygma exigua* on 15 June, 17 July and 11 September, one *Leucania vitellina* on 15 September and one *Leucania unipuncta* on 18 September. The most surprising captures were two specimens of *Catocala nymphagoga* Esper, a species new to Britain, one at site no. 331, Tregaron in Central Wales on 28 July and a second at site no. 368, Denny Lodge in the New Forest, on 31 July (Tillotson, 1983).

Another first record, this time for site no. 146, Jersey, in 1981, was the capture of one specimen of *Heterostegane cararia* Hbn. in the period 1–3 August. This species has not previously been recorded in Jersey or mainland Britain.

Once again, voluntary workers operated most traps and identified many of the insects; for their help we are most grateful. Members of staff in the Entomology Department at the British Museum (Natural History) identified *Catocala nymphagoga* and confirmed the identification of *Heterostegane cararia* and we thank them for this.
