Rothamsted Experimental Station Report for 1984

[Full Table of Content](#)

Rothamsted Insect Survey, Sixteenth Annual Summary

L. R. Taylor, I. P. Woiwod, E. D. M. Macaulay, M. J. Dupuch and J. Nicklen

L. R. Taylor, I. P. Woiwod, E. D. M. Macaulay, M. J. Dupuch and J. Nicklen (1985) *Rothamsted Insect Survey, Sixteenth Annual Summary* ; Rothamsted Experimental Station Report For 1984, pp 285 - 315 - DOI: <https://doi.org/10.23637/ERADOC-1-34041>

Rothamsted Insect Survey

Sixteenth Annual Summary

L. R. TAYLOR, I. P. WOIWOD, E. D. M. MACAULAY,
MAUREEN J. DUPUCH and JOAN NICKLEN

Suction traps 1984

Daily samples were collected from 2 April to 11 November 1984. *Aphid bulletins* were issued weekly from 16 April (*Bulletin* No. 1) to 18 November (*Bulletin* No. 31). The 33 aphid taxa listed in Table 1 (a-h) are those in the *Aphid Bulletin*.

The suction traps at (916) Elgin, (907) Dundee, (912) East Craigs, (931) Pathhead, (923) Auchincruive, Ayr and also (925) Stirling are entirely operated by Dr L. A. D. Turl and colleagues at the Department of Agriculture and Fisheries for Scotland (DAFS), East Craigs.

The trap at (927) Belfast did not operate until 10 April. The trap at (928) Rainham only operated from 5 March to 17 July; it only appeared on *Bulletins* up to 15 July and in Table 1 (a-d).

Suction traps sampling at 5 ft (1.5 m) were operating at (954) East Craigs, (956) Ingraston and (951) Rothamsted Tower; records for these do not appear on *Bulletins* nor in Table 1.

Samples from (911) Aberystwyth were identified by Mr J. A'Brook and Mr H. Evans of the Welsh Plant Breeding Station; Mr W. A. Thornhill and Dr A. M. Dewar of Broom's Barn Experimental Station identified catches from (904) Broom's Barn. The samples from the Scottish traps were identified by Dr L. A. D. Turl, Dr K. F. A. Walters and Mr F. G. Doyle of the Department of Agriculture and Fisheries for Scotland, East Craigs. We appreciate their co-operation, in providing information for the weekly *Bulletins* and for Table 1.

The *Bulletin*, despatched each Friday, lists aphids caught between 5 and 12 days earlier. This timing is dictated by the postal services.

The *Bulletins* cover the working week Monday to Sunday. Table 1 is for standard four-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4). *Bulletin and Standard weeks do not correspond*.

Sample volumes were halved at various sites as follows: (908) Silwood Park from 15 June to 5 September, (917) Hereford, (914) Long Ashton, (933) Littlehampton and (913) Starcross from 16 June to 5 September, (928) Rainham from 17 June to 17 July, (901) Rothamsted Tower from 19 June to 4 September, (922) Preston, (919) Shardlow, (924) Writtle and (903) Wye from 20 June to 5 September, (934) Kirton from 17 July to 5 September, (911) Aberystwyth 26 July, for one day only. In addition, when numbers were high, catches were sub-sampled in the laboratory to reduce the pressure of work. The weekly *Bulletins* and Table 1 (a-h) are corrected to full volume sample.

In Table 1 (a-h) there are no missing values, a blank records a zero catch.

The most notable feature of 1984 was the large numbers of *Sitobion avenae* in mid-summer throughout England. However, data are not available for the regional variation in crop infestations on wheat.

Two species, *Brachycaudus helichrysi* and *Hyalopterus pruni*, that are occasional pests of plums, were recorded in low numbers. In contrast, another fruit-tree pest, *Rhopalosiphum insertum*, migrated from apple in southern England in large numbers, but the subsequent migrations from Graminae were unusually small giving three seasonal migrations of similar size.

ROTHAMSTED REPORT FOR 1984, PART 2

An unusually large number of male *Metopolophium dirhodum* and *Brevicoryne brassicae* were recorded this spring, especially in southern England. Total *B. brassicae* numbers were generally large, particularly at Hereford and Littlehampton.

1984 produced the largest autumn migration ever of *Myzus persicae* in the East Anglian traps at Broom's Barn and Kirton, but as yet it is not known from which host plants they originated. Elsewhere *M. persicae* numbers were not unusual.

Light traps

Table 2 (a-f) gives the annual catches during 1982 and 1983 of the same pest, or migratory Lepidoptera as in previous years.

Seventy-one sites completed the 364-day sample for 1983.

The sites in Table 2 are arranged in sequence from north to south, and the species in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

As in other years, records of additional species of note were sent to Bretherton and Chalmers-Hunt. They reported (1984) 1983 as another year of abundance in particular with total records of over 1000 *Rhodometra sacraria* exceeding the 'Vestal year' of 1947. Survey traps at the following sites (with site no.) contributed to the total: Alice Holt, Hampshire (46), Rosewarne, Cornwall (114), Yarner Wood, Devon (266), Westonbirt, Gloucestershire (292), Castletown, I.O.M. (306), Cockayne Hatley, Bedfordshire (336), Rhandirmwyn, Dyfed (346), Compton Park, Staffordshire (424), and Evesham, Worcestershire (444). Survey traps also caught the following migrant or 'out-of-place' species: *Nycterosea obstipata*, five during October and November at site no. 266, Yarner Wood; *Nola albula*, one 22 July at site no. 266, Yarner Wood; *Leucania unipuncta*, one 2 October at site no. 114, Rosewarne; *Heliothis armigera* one 2 October at site no. 114, Rosewarne; *Idea ochrata*, one 19 July at site no. 34, Allotments, Rothamsted, Hertfordshire, a species normally considered coastal (Riley, 1984b); *Thaumetopoea processionea*, one 18 August at site no. 252, Guernsey.

Two species exhibiting unusual forms were recorded; the first, *Cycnia mendica*, ab. *rustica* appeared at site no. 99, Geescroft II (Rothamsted, Hertfordshire) on 2 May 1984; the second *Sterrhia biselata* ab. *griseata* made another of its regular appearances at site no. 277 Ewingswode, Cambridgeshire in 1982 (Riley, 1984d).

Survey traps also recorded some first county records for the following species: *Eupithecia valerianata* at site no. 421 Rogart, Sutherland (Riley 1984c); *Furcula bifida* at site no. 438 Beaumaris, Anglesey (Riley 1984e); *Deileptenia ribeata* at site no. 339, Glentress, Peeblesshire; *Eupithecia distinctaria* at site no. 339, Glentress, Peeblesshire. One other species, *Hadena luteago barrettii* has extended its range in southern Wales to site no. 333, Tregaron and site no. 440, Aberporth, both in Dyfed (Riley 1984a).
