Rothamsted Research (1876) *Experiments on Permanent Meadow Land; the Park* ; Yields Of The Field Experiments 1875, pp 2 - 2 - DOI: <https://doi.org/10.23637/ERADOC-1-239>

THE PARK.

EXPERIMENTS WITH DIFFERENT MANURES ON PERMANENT MEADOW LAND.

The Land has probably been laid down with Grass for some centuries. No fresh seed has been artificially sown within the last 40 years certainly; nor is there record of any having been sown since the Grass was first laid down. The experiments commenced in 1856, at which time the character of the herbage appeared uniform over all the Plots. Excepting as explained in the Table and in the foot-notes, the same description of Manure has been applied year after year to the same Plot.

(Area under experiment, about 7 acres.)

(1) "Ammonia-salts"—In all cases equal parts Sulphate and Muriate of Ammonia of Commerce.
 (2) The "Superphosphate of Lime" is, in all cases, made from 200 lbs. Bone-ash, 150 lbs. Sulphuric Acid, 5 gr. 1.7 (and water).
 (3) Plots 6, 8, and 10, had, besides the Manures specified, 2000 lbs. Sawdust per acre per annum for the first 7 years, 1856-1862, but without effect.
 (4) 200 lbs. 1856-65 inclusive.
 (5) 500 lbs. in 1862 and 1863.
 (6) Only 300 lbs. in 1863-60-61.
 (7) The application of Silicates did not commence until 1862.
 (8) 550 lbs. Nitrate of Soda is reckoned to contain the same amount of Nitrogen as 400 lbs. of "Ammonia-salts."
 (9) Average of 15 years only, as the manures specified were first applied in 1859 (previously, 1856-7 and 8, sawdust only).
 (10) Average of 6 years only, as these experiments did not commence until 1855.
 (11) Average of 9 years only, as the experiment only commenced in 1863.
