GEESCOFT FIELD.

EXPERIMENTS ON THE GROWTH OF OATS YEAR AFTER YEAR ON THE SAME LAND; WITHOUT MANURE, AND WITH DIFFERENT KINDS OF MANURE.
 Previous Cropping—1847 and 1848, Clover, Experimental Manures; 1849—1859, Beans, Experimental Manures; 1860, Fallow; 1861 and 1862, Wheat, Unmanured; 1863, Fallow;
 1864, Beans, Dunged; 1865, Wheat, Unmanured; 1866, Beans, Unmanured; 1867 and 1868, Wheat, Unmanured.
 First Experimental Oat Crop in 1869.
 (Area under Experiment, $\frac{1}{4}$ acre.)

(1) "Superphosphate of Lime"—in all cases, made from 200 lbs. Boneash, 150 lbs. Sulphuric Acid sp. gr. 1·7 (and water).

(2) "Ammonia-salts"—In each case, equal parts Sulphate and Murate of Ammonia of Commerce.

(3) 550 lbs. Nitrate of Soda contain the same amount of Nitrogen as 400 lbs. "Ammonia-salts."

(4) On these plots, where large quantities of Nitrate of Soda had been applied year after year, the land, though more worked, was so wet that it could not be got into favourable condition for sowing, and the plant was very irregular.

(5) owing to the extremely wet condition of the land, especially on the Nitrate plots, it was not sown until April 6, and then with a heavy fall of snow a week later, the plant came up very irregularly, and much of it perished from standing surface-water.

(6) Owing to the very wet winter, 1876–7, the land could not be worked in time for sowing, and was therefore left fallow in 1877.
