EXPERIMENTS ON SUGAR BEET (VILMORIN'S GREEN-TOP WHITE SILESIAN)-BARN FIELD.

GROWN YEAR AFTER YEAR ON THE SAME LAND, WITHOUT MANUEE, AND WITH DIFFERENT DESCRIPTIONS OF MANUEE, COMMENCING 1871.

GROWN YEAR AFTER YEAR ON THE SAME LAND, WITHOUT MANURE, AND WITH DIFFERENT DESCRIPTIONS OF MANURE, COMMENCING 1871. Previous Cropping :--1843-'48 (6 Seasons), experiments on Norfolk White Turnips, with different descriptions of Manure. 1849-'52 (4 Seasons), experiments on Swede Turnips, with different descriptions of Manure. 1855-'55 (3 Seasons), Barley without Manure (with a view as far as possible to equalise the condition of the Plots). 1856-'70 (15 Seasons), experiments on Swede Turnips, with different descriptions of Manure. Plots was the same, and that of the Manures very similar-in fact, exactly the same during the last 10 years-as in the first year of Sugar Beet, excepting that, during those 10 years, the Alkalies were omitted for the Swedes. For the second and subsequent years of Sugar Beet slight alterations in the Mineral Manures were made, and in the fourth and fifth years the Farmyard Manure, Nitrate of Soda, Ammonia-salts, and Rape-cake were omitted, as will be seen below. Seed dibbled on the flat; in rows 22 inches apart, and 11 inches apart in the rows; plants moulded up afterwards. Roots all carted off, Leaves weighed, spread on the respective Plots, and ploughed in. Area under experiment shout 8 agree. The concriments are arranged as under in 5 Series, each of which comprises 9 Plots

Area under experiment about 8 acres. The experiments are arranged as under, in 5 Series, each of which comprises 8 Plots.

	Area under experiment about 6 acres. The experi-		es, per Acr

EXPERIMENTS ON SUGAR BEET-BARN FIELD-continued.

As it will be some time before we shall be able to report fully the results obtained illustrating the influence of different manures, and different seasons, on the composition of Sugarbeet, an abstract of the analytical results obtained is given below. In interpreting the figures it must be borne in mind that with forty different experiments each year, and in each year 4 or 5 or more times as much produce on some plots as on others, it would be impossible to sample each at its best, and all in the same condition of ripeness. Each year the seed was sown on all the Plots at the same time; and the samples (each consisting of the vertical fourths of 10 or 15 roots) were taken from all within a period of about a week, beginning with the ripest. It is obvious, however, that the snaller crops would be much riper than the larger ones. It need only further be observed that although, in comparable cases, the larger crops generally give a juice containing a lower percentage of sugar and higher percentages of mineral matter and of nitrogen, yet, the larger crops yielded very much more sugar over a given area of land.

I. MEAN PER CENT. SUGAR, MINERAL MATTER (CRUDE ASH), AND NITROGEN, IN JUICE, in Selected cases, each year; 5 years, 1871-5;

II. AVERAGE PRODUCE and Composition of the Roots; First Three Seasons, 1871, 1872, and 1873.
