EXPERIMENTS ON MANGOLD WURZEL.—BARN FIELD (after SUGAR-BEET); commencing 1876.

The arrangement of the Plots is precisely the same as previously for Sugar-beet, excepting that Plot 9, which was unmanured for Sugar-beet, and also previously for Swedes, is now added as a manured Plot. With this exception, the manures are also substantially the same as previously for Sugar-beet; in fact, precisely the same as for the Sugar-beet in 1872 and 1873. Seed, Yellow Globe; dibbled on ridges, rows 26 inches apart; plants 11 inches apart in the rows (3). Area under experiment about 8 acres. Roots all carted off; Leaves weighed, spread on the respective Plots, and ploughed in.

## EXPERIMENTS ON MANGOLD WURZEL.—BARN FIELD—continued.

#### SUMMARY OF THE COMPOSITION OF THE MANGEL ROOTS.

Summary of the Composition of the Mangel Roots.

As it will be some time before we shall be able to report fully the results obtained, or to be yet obtained, illustrating the influence of different manures, and of different seasons, on in the roots themselves. The sugar is determined in the expressed juice; and calculated into its percentage in the roots, on the assumption that they contain uniformly 96 per cent. represent both the actual and relative amounts of sugar in the various roots. According to the recent experiments of Schiebler, and others, on Sugar-beet, the percentage of and supposing them to apply to mangolds, the amount of true juice would average not much more than 90, instead of 96 per cent.; and if so the percentage of sugar in the roots, expensions of given in the roots, perhaps from \(\frac{1}{3}\times\) \(\frac{1}{3}\times\) less) than given in the Table below. The amounts of dry matter, ash, and nitrogen, are of course determined of juice. But, will be less (perhaps from \(\frac{1}{3}\times\) \(\frac{1}{3}\times\) less) than given in the Table below. According to the recent experiments of Schiebler, and others, on Sugar-beet, the percentage of and supposing them to apply to mangolds, the amount of true juice would average not much more than 90, instead of 96 per cent.; and if so the percentage of sugar in the roots expressed juice. In many cases also, the amount of the nitrogen existing as albuminoids has been determined (by Church's method); and in some cases the amount of the nitrogen existing as albuminoids has been determined (by Church's method); and in some cases the amount as an independent of the process of the percentage of the nitrogen of the roots is found in the juice; and of the nitrogen in Interpreting the figures; it must be borne in mind, that, with forty different experiments each year, and, in each year four, or five, or more, times, as much produce on some plots sample analysed was in each case a mixture of vertical sections of ten or fifteen roots, and all the samples we
