GREEN MANURING EXPERIMENT

Woburn Stackyard - 1954, the 1st year of revised scheme

Original scheme: Details are given in "Results of the Field Experiments 1939-47", Vol I, Section Be/1. In 1950 the fallow, lupins and rye-grass plots were split for early and late planting of cabbages. The original scheme ended with the harvesting of barley in 1953 and the cabbages in 1953-4.

Revised scheme: From 1954 onwards the rotation is: early potatoes, barley. As before each of these two crops is grown in every year on one of two randomized blocks of 40 plots each. The green manuring crops are grown according to the following scheme which is repeated every two years:

1st main crop	Early Potatoes	Early Potatoes	Early Potatoes	Early Potatoes	Early Potatoes
Green manure	-	Ryegrass	Ryegrass	Trefoil	Trefoil
2nd main crop and green manure	Barley -	Barley undersown with Ryegrass	Barley -	Barley undersown with Trefoil	Barley -

8 plots of each block are allocated to each of these sequences. Half the plots of each group carrying ryegrass or trefoil after early potatoes are ploughed in autumn and the remainder are ploughed in the spring before the barley seedbed is prepared. The undersown green manures are ploughed in after February 1st for early potatoes.

In addition chaffed barley straw at the rate of 30 cwt per acre is applied after harvesting the barley to the plots receiving straw in the original scheme. Two levels of nitrogen are tested on each of the two main crops.

0.23 v. 0.46 cwt N per acre as nitrochalk to barley
0.6 v. 1.2 cwt N per acre as nitrochalk to potatoes

the higher level in each case being applied to the same plots.

The fallow plots of the original scheme remain fallow between each main crop in the revised scheme. The new green manuring treatments are superimposed on the plots carrying the original treatments in such a way that one comparison of the latter (lupins and rape v. clover and ryegrass) can be examined for possible residual effects. Residual effects of the original dung treatment, now discontinued, can also be determined, but any residual effects of the nitrogen treatments applied prior to 1954 have been eliminated by randomization. The green manuring and subsidiary treatments are arranged on the 32 non-fallow plots of each block in a quarter replicate with identities:

https://doi.org/10.23637/ERADOC-1-184

I ≡ (D) SPUGN ≡ (D)(X)UN ≡ S(X)PG

where (D) = (residual) dung.
(X) = (residual) rape and lupins v. clover and ryegrass.
S = straw.
P = time of ploughing green manures after early potatoes.
U = green manures undersown (in addition to those sown after early potatoes).
G = trefoil v. ryegrass.
N = nitrogen levels to both crops.

Basal dressing: Early potatoes, 0.75 cwt P_2O_5, 1.5 cwt K_2O per acre as granular compound fertilizer, broadcast on the flat before machine planting. Barley and green manures, nil.

Varieties: Early potatoes: Ulster Chieftain
Barley: Herta
Trefoil: English
Ryegrass: English Leafy Italian.

Plot area: 0.0395 acre.

Transition Period:
The barley of 1954 received two levels of nitrogen and was undersown according to the new scheme.

The early potatoes of 1954 received two levels of nitrogen according to the new scheme. It is not possible to make full comparisons of the old treatments in either of these crops. A full analysis of the new scheme will first be possible in 1955.

Cultivations, etc.:
Green manures: Clover and ryegrass undersown in barley: Apr 24, 1953.
Barley: Ploughed: Mar 5, 1954. Ground chalk applied: Mar 11. Nitrochalk applied: Mar 16. Seed drilled at 3 bushels per acre: Mar 17. Trefoil and Italian ryegrass undersown: Apr 27. Harvested: Aug 30. Variety: Herta.
Early potatoes: Ploughed (except for green manured plots): Aug 21, 1953, Oct 2, Dec 2, and Mar 1, 1954. Ploughed (all plots): Mar 10. Nitrochalk and basal fertilizers applied: Mar 24. Potatoes mechanically planted: Mar 26. Earthed up: June 15 and again June 25. Lifted: July 28. Variety: Ulster Chieftain.

Standard errors per plot:
Early potatoes, Total tubers: 0.973 tons per acre or 21.8% (22 d.f.)
Barley, Grain: 3.01 cwt per acre or 7.8% (18 d.f.)

WOBURN MARKET GARDEN EXPERIMENT

Organic manures and N - Lansome 1954 the 13th year.

The present cropping comprises two series, each carrying in turn the crops of a two course rotation: 1st year - Globe beet followed by spring cabbages; 2nd year - Leeks.

Note: The results for the spring cabbages 1954-55 will be included in the 1955 report.

System of replication (each series): 4 randomized blocks of 10 plots each, certain interactions being confounded with block differences.

Area of each plot: 0.0125 acre.

Treatments applied to each crop:

Organic manures: Dung; sewage sludge compost; sewage sludge (West Middlesex); vegetable compost, each at 10 and 20 tons per acre.

N (applied as nitrochalk): None; 0.3 cwt per acre on plots receiving organic manure. None; 0.3; 0.6; 0.9 cwt per acre on plots not receiving organic manure. The last two rates are applied in two equal dressings.

Basal manuring per acre to each crop: 0.3 cwt P_2O_5; 0.3 cwt K_2O, applied as granular fertilizer (13% P_2O_5; 13% K_2O).

Cultivations, etc.:

Globe beet. Organic manures applied and ploughed in: Mar 31. Nitrochalk and basal fertilizers applied: May 10. Seed drilled at 13 lb per acre: May 11. Singled: June 16. Second dressing of nitrochalk: June 25. Sprayed with systemic insecticide: June 21. Harvested: Aug 13 - Sept 21. Variety: Detroit.

Leeks. Organic manures applied and ploughed in: July 22. Nitrochalk and basal fertilizers applied: July 27. Planted: Aug 3. Second dressing of nitrochalk applied: Sept 22. Harvested: Mar 8 - 31, 1955. Variety: Musselburgh.

Standard errors per plot.

Globe beet, saleable bulbs: 1.15 tons per acre or 17.3% (17 d.f.)
Leeks, saleable produce: 0.316 tons per acre or 10.8% (17 d.f.)

The effects of various crop sequences on the incidence of Eyespot (Cercosporella herpotrichoides) - Little Knott 1954, the 5th year.

Arrangement of previous treatment crops: 4 longitudinal and 8 cross strips, each plot being split into 2 for seed rates.

Area of each sub plot: In 3 longitudinal strips - 0.0249, in the other 0.0174. Area harvested: 0.0156 and 0.0108 acre, respectively.

Preparatory crops 1950-52:-

1950 North and South, strips of Fallow, Ryegrass, Wheat, Potatoes
1951 East and West, strips of Ryegrass, Wheat, Fallow, Potatoes
1952 East and West, strips $\frac{1}{2}$ width Ryegrass, Wheat, Oats, Beans
Wheat, Oats, Barley, Wheat

giving 32 crop sequences in all.

In 1949 the field carried a crop of wheat heavily infested with Eyespot, Take-all (Ophiobolous graminis) and weeds. Wheat was grown on all plots in 1953.

Seed rates: $1\frac{1}{2}$; 3 bushels per acre.

Basal dressing per acre: 1 cwt compound granular fertilizer (12% N, 12% P_2O_5, 12% K_2O) combine drilled with seed. 6 cwt nitrochalk in two equal applications in March and May.

Cultivations, etc: Ploughed: Sept 17, 1953. Seed combine drilled: Nov 6. 1st application of nitrochalk: Mar 13, 1954. 2nd application: May 10. Combine harvested: Sept 13. Variety: Cappelle. Previous crop: Wheat.

Note: Disease surveys were made and the results are available.

In general reading of the text there will be no great inaccuracy in regarding:

1 lb = 0·5 kg
1 lb ac^{-1} = 1 kg ha^{-1}

Plant nutrients

Plant nutrients are best stated in terms of amounts of the elements (P, K, Na, Ca, Mg, S); the old 'oxide' terminology (P_2O_5, K_2O, Na_2O, CaO, MgO, SO_3) is still used in work involving fertilisers and liming since Regulations require statements of P_2O_5, K_2O, etc.

For quick conversions

(accurate to within 2%) the following factors may be used:

$2\frac{1}{3} \times P = P_2O_5$	$\frac{3}{7} \times P_2O_5 = P$
$1\frac{1}{5} \times K = K_2O$	$\frac{5}{6} \times K_2O = K$
$1\frac{2}{5} \times Ca = CaO$	$\frac{7}{10} \times CaO = Ca$
$1\frac{2}{3} \times Mg = MgO$	$\frac{3}{5} \times MgO = Mg$

For accurate conversions:

To convert	*Multiply by*	*To convert*	*Multiply by*
P_2O_5 to P	0·4364	P to P_2O_5	2·2915
K_2O to K	0·8301	K to K_2O	1·2047
CaO to Ca	0·7146	Ca to CaO	1·3994
MgO to Mg	0·6031	Mg to MgO	1·6581
