BARLEY - HOOSFIELD 1961

For history, treatments, etc., see "Details of the Classical and Long Term Experiments" 1956.

In 1961 all strips drilled for combining were taken for grain yields, except on plots 1N, 2N, 5-0 and 5A where one of the inner two strips only was taken.

For straw yields one of the inner two strips was taken on each plot, except on plots 6-1 and 6-2 where the centre strip of the three, and on plots 7-1 and 7-2 where the northern one of the two, was taken.

Cultivations, etc.: Sprayed with dalapon at 10 lb in 40 gallons per acre: Sept 24, 1960; and again at 5 lb in 40 gallons per acre: Oct 11. Dung applied: Dec 12. Ploughed: Dec 13. Minerals applied: Mar 28, 1961. Nitrogen fertilisers applied: Apr 4. Seed drilled at $2\frac{3}{4}$ bushels per acre: Apr 12. Strips 1, 2 and 3 sprayed with MCPA at $6\frac{1}{2}$ pints in 40 gallons per acre; and strips 4, 6 and 7 sprayed with CMPP at 6 pints in 40 gallons per acre: May 19. Combined: Aug 28. Variety: Plumage Archer.

GRASS AND MULTIPLE CROPPING AND DIRECT AND RESIDUAL P

AGDELL 1961

For history, treatments, etc., see "Details of the Classical and Long Term Experiments" 1956.

Multiple cropping 1961

In order to investigate further the residues of past treatments by testing methods of incorporating P fertiliser in the soil, the crop strips on 3 of the old rotation plots (numbers 1, 3 and 5) were split lengthways to give two sub plots for each of the three 1959 treatments. The new sub plots carry the treatments described below. The areas carrying strip crops in 1960 on plots numbers 2, 4 and 6 were bare fallowed. Yields were taken from the cocksfoot ley sown in 1960.

Rotation (commencing 1959): barley, potatoes, sugar beet.

Area of each sub plot (acres): 0.0050. Area harvested: 0.0035.

Treatments per acre: None; 0.75; 1.50 cwt P_2O_5 either ploughed in or applied in seedbed; also 0.75 cwt P_2O_5 ploughed in plus 0.75 cwt P_2O_5 in seedbed; 1.5 cwt P_2O_5 ploughed in plus 1.5 cwt P_2O_5 in seedbed. P_2O_5 as superphosphate; for potatoes "seedbed" P was applied in bouts.

Basal dressings per acre. To grass: as 1959.
To barley: 0.3 cwt K_2O ploughed in, and 0.6 cwt N, 0.6 cwt K_2O broadcast in seedbed as compound fertiliser, 16% N, 16% K_2O.
To potatoes: 0.6 cwt K_2O ploughed in, 0.6 cwt K_2O after ploughing, 1.2 cwt N and 1.2 cwt K_2O as compound fertiliser, 16% N, 16% K_2O applied to ridged land before planting.
To sugar beet: 1.0 cwt K_2O ploughed in, 1.0 cwt K_2O after ploughing, 1.0 cwt N and 1.0 cwt K_2O as compound fertiliser, 16% N, 16% K_2O broadcast in seedbed.

Note: Apart from the NK compound fertiliser, K_2O was applied as sulphate of potash.

Cultivations, etc.:
Grass. 'Nitro-Chalk' applied: Mar 9, 1961. Cut 3 times: May 17, July 18, Sept 15. 'Nitro-Chalk' applied after 2nd cut.
Fallow areas. Ploughed: Jan 17, 1961. Rotary cultivated: May 11, June 3.
Microplots. Fertilisers applied for ploughing in: Dec 5, 1960. Ploughed: Jan 17, 1961.
Barley: Seedbed fertilisers applied, seed drilled at 3 bushels per acre: Mar 16, 1961. Harvested: Aug 9. Variety: Proctor.
Potatoes: K applied after ploughing: Mar 7, 1961. Rotary cultivated and ridged, fertilisers applied in the bouts: Apr 25. Potatoes planted: May 1.

https://doi.org/10.23637/ERADOC-1-182

Sprayed 3 times with demeton methyl at 12 fluid oz in 40 gallons per acre: June 7 and 16, July 11. Sprayed twice with copper fungicide at 5 lb in 40 gallons per acre: Aug 15, Sept 1. Lifted: Sept 25. Variety: Majestic (chitted).

Sugar beet. K applied after ploughing: Mar 7, 1961. Seedbed fertilisers applied, seed drilled at 20 lb per acre: Mar 23. Singled: May 29. Sprayed 3 times with demeton methyl at 12 fluid oz in 40 gallons per acre: June 7 and 16, July 11. Lifted: Oct 10. Variety: Klein E.

CLOVER - ROTHAMSTED GARDEN 1961

The 108th year

For history, etc. see "Details of the Classical and Long Term Experiments" 1956.

Molybdenum test 1961: The two plots were sub-divided as in 1960 for a test of molybdenum:-

None; 1 lb sodium molybdate per acre, applied by adding the appropriate quantity in solution in water to dry sand, broadcasting and raking in.

Cultivations, etc.: Muriate of potash applied at 2 cwt per acre: Nov 16, 1960. Ground chalk applied at 30 cwt per acre, plots dug and old clover plants removed: Mar 16, 1961. Second dressing of muriate of potash at 2 cwt per acre and ground chalk at 30 cwt per acre applied: Mar 17. Sodium molybdate applied and seed sown at 40 lb per acre: Apr 13. Cut twice: Sept 4 and Nov 1. Variety: Late Flowering Red S123.

Note: Germination on the perimeter of the area of the plots was poor. This was still noticeable at the time of the 1st cut; but the plant had evened out at the time of the second cut.

For history, treatments, etc., see "Details of the Classical and Long Term Experiments" 1956.

Strip cropping and microplots 1961: Wheat and barley were sown in strips as in 1960. The microplots were continued with crops interchanged, and were extended to include a strip of sugar beet along their south eastern edge, following wheat in 1960. Plots 7, 8 and 9 of the Continuous Wheat experiment were bare fallowed.

LEY AND ARABLE ROTATIONS

Highfield and Fosters Field 1961 - the 13th year.

For details of treatments, rotations, etc. see "Details of the Classical and Long Term Experiments" 1956.

Treatment crops, reseeded and permanent grasses: Each crop is manured uniformly, the sub plot tests of N and dung being discontinued.

Test crops: For new sub plot treatments see below.

Arable rotation: 2 cuts are now taken from the hay crop. The treatment potato crop is replaced by sugar beet.

Corrective K: 3 cwt per acre K_2O as sulphate of potash was applied to all phases of the arable rotation.

Revised basal fertiliser applications:

WOBURN MARKET GARDEN EXPERIMENT

Organic manures, N,P,K and Mg - Lansome Field 1961, the 20th year of the experiment, the 1st year with revised treatments.

Revised treatments commencing 1961:-

The following treatments are now discontinued:
No organics with none; 0.3; 0.6; 0.9 cwt N per acre.
N at 0.3 cwt per acre to plots receiving organics.

The following treatments are now superimposed on the existing design:-

To plots without organics: all combinations of:
Nitrogen: 0.9; 1.8 cwt N per acre as 'Nitro-Chalk'. (N_1: N_2)
Phosphate and potash: 1.5 cwt P_2O_5 with 1.5 or 3.0 cwt K_2O per acre as compound fertiliser 20% P_2O_5, 20% K_2O or 14% P_2O_5, 28% K_2O. (P_1K_1: P_1K_2)
There are 2 plots per series for each of the above factorial combinations and of these one has all its fertiliser applied for all crops in the seedbed; the other has half its PK (for potatoes) and half its NPK (for beet and leeks) ploughed in with the organics; the remainder of its dressing is reserved for seedbed application.

To plots receiving organics at 10 and 20 tons per acre: NPK at the lower rate shown above v no fertiliser (2 plots per series for each treatment).

In addition all plots are split for a test of 0 v 500 lb of magnesium sulphate per acre.

Area of each plot (acres):		Area harvested (acres):
Leeks (whole plot)	0.0125	0.0104
Early potatoes (sub plot)	0.0063	0.0023
Globe beet (sub plot)	0.0063	0.0011

Harvesting of globe beet: These are now harvested on 2 dates, about one month apart, 3 rows per sub-plot being harvested on each date.

Note: The results for the 1961-62 leeks will be included in the 1962 report.

Cultivations, etc.:

Leeks 1960-61. Organic manures applied (vegetable compost, at ½ rate): July 20, 1960. Ploughed: July 21. 'Nitro-Chalk' and basal fertiliser applied, leeks planted: July 25. Second dressing of 'Nitro-Chalk' applied: Sept 9. Harvested: Feb 22-Apr 6, 1961. Variety: Musselburgh.

IRRIGATION EXPERIMENT

The 11th year - revised 1960

The effects of irrigation and nitrogen - Woburn Butt Close 1961.

For details of previous cropping, treatments etc. see "Details of the Classical and Long Term Experiments" 1956.

Cut grass: The basal PK compound is now applied in winter. Applications of muriate of potash are now made in spring and after each cut except the last at the rates 0.3; 0.6 cwt K_2O per acre. Plots of the different treatments may be cut and manured independently if rates of growth vary. (applied to ½ plots)

Beans: Owing to weather conditions the third year crop in the rotation was spring, and not winter beans.

Area of each whole plot (acres): Spring beans: 0.0555.
Sub plots (acres): Grass: 0.0264; remainder: 0.0277.
Area harvested (acres): Early potatoes: 0.0171; barley: 0.0098; spring beans: 0.0181; Cut grass: 0.0165.

WW = Winter wheat, SW = Spring wheat, O = Oats, B = Barley, Be = Beans.

In the 4th year the plots are split for N and all cropped with winter wheat, the series starting in 1958 falling due for this treatment this year, and receiving N at 0.5, 1.0 cwt per acre in 2 doses on Mar 22 and May 8, 1961 as 'Nitro-Chalk'.

Basal dressing: 2 cwt compound fertiliser (16% P_2O_5, 16% K_2O) per acre combine drilled with seed (placed in sideband for beans); all blocks received 23 cwt ground chalk per acre in Nov 1956 and 54 cwt per acre in Oct 1960.

Nitrogen for cereals: 0.46 cwt N as 'Nitro-Chalk' 21 per acre to spring wheat and 0.31 cwt N as 'Nitro-Chalk' 21 per acre to barley, all in seedbed.

Cultivations, etc.: Ground chalk applied: Oct 4 - 14, 1960. Ploughed: Oct 14. Winter wheat combine drilled at 3 bushels per acre: Jan 23, 1961. 'Nitro-Chalk' applied to spring wheat and barley: Mar 7. Beans placement drilled at 200 lb per acre, barley combine drilled at 2 bushels per acre, and spring wheat at 3 bushels per acre: Mar 8. Nitrogen: Applied to continuous crops and to the winter wheat and barley in treatment 10 - none; 0.3; 0.6; 0.9 cwt N per acre as 'Nitro-Chalk'.

*In this case, because of bad weather, spring instead of winter wheat was sown.

Combine drilling of nitrogen - Woburn, Great Hill 1961.

Design: 4 randomised blocks of 7 plots each.

Area of each plot: 0.0148 acres. Area harvested: 0.0104 acres.

Treatments:

No nitrogen. 0.40 cwt N per acre (N_1); 0.77 cwt N per acre (N_2) either broadcast as sulphate of ammonia or combine drilled as part of a compound fertiliser.

0.40 cwt N per acre as above plus 0.37 cwt N per acre as 'Nitro-Chalk' top dressing.

Compound fertilisers used:

N_1: 8% N, 8% P_2O_5, 8% K_2O.

N_2: 16% N, 9% P_2O_5, 9% K_2O.

Basal dressing per acre: 0.43 cwt P_2O_5 and 0.43 cwt K_2O combine drilled:

(a) on the plots receiving drilled nitrogen, as compounds N_1, N_2.

(b) on the no nitrogen and broadcast nitrogen plots, as compound 20% P_2O_5, 20% K_2O.

Cultivations, etc.: Ploughed Oct 17 - Dec 8, 1960. Seed combine drilled at 2¾ bushels per acre, sulphate of ammonia applied: Mar 10, 1961. 'Nitro-Chalk' top dressings applied: Apr 21. Sprayed with TCB/MCPA at 4 pints in 40 gallons per acre: May 3. Combine harvested: Aug 29. Variety: Jufy I. Previous crop: Barley.

Note: The very low yields were in part due to a severe attack of Fusarium, which was worst on the plots receiving nitrogen.

Design: 4 randomised blocks of 9 plots each.

Area of each plot: 0.0565 acres. Area harvested: 0.0141 acres.

Treatments. All combinations of:-

Copper spraying: None; sprayed on 3 occasions with copper fungicide.

Burning off haulm: None; haulm burnt off. Two plots per block for each factorial treatment. In addition one plot per block was sprayed on the second and third occasions with copper fungicide and the haulm burnt off.

Basal dressing: 7 cwt per acre compound fertiliser, 17% N, 11% P_2O_5, 22% K_2O.

Cultivations, etc.: Ground chalk applied at 24 cwt per acre: Sept 6 - 17, 1960. Ploughed: Apr 27, 1961. Rotary cultivated, basal dressing applied, potatoes machine planted: May 2. Earthed up: July 7. Appropriate plots sprayed with copper fungicide at 5 lb in 30 gallons per acre: July 19, Aug 18, Sept 5. Appropriate plots sprayed with undiluted BOV at 15 gallons per acre: Sept 21. Lifted: Oct 18. Variety: King Edward. Previous crop: Barley.

+The experiment was converted to measuring the detrimental effects of copper without interference from blight as there was an exceptionally late and slight attack of the disease. As a result of this alteration the treatments described are not as originally planned.

Note: Periodic samples were taken of the weight of tops and tubers, and an assessment of blight on foliage and in tubers was made.

CONVERSION FACTORS

Factors for the Conversion of Imperial to Metric Units

1 inch (in.)	= 2·540 centimetres (cm)
1 foot (ft) (=12 in.)	= 30·48 cm
1 yard (yd) (=3 ft)	= 0·9144 metre (m)
1 square yard (yd²)	= 0·8361 m²
1 acre (ac) (=4840 yd²)	= 0·4047 hectare (ha)
1 ounce (oz)	= 28·35 grams (g)
1 pound (lb)	= 0·4536 kilogram (kg)
1 hundredweight (cwt) (=112 lb)	= 50·80 kg
1 ton (=2240 lb)	= 1016 kg = 1·016 metric tons (tonnes) (t)
1 pint	= 0·5682 litre (l)
1 gallon (gal) (=8 pints)	= 4·546 litres
1 fluid ounce = 1/20 pint	= 0·02841 litre = 28·41 ml
1 cubic foot	= 28·32 litres

To convert	*Multiply by*
oz ac^{-1} to g ha^{-1}	70·06
lb ac^{-1} to kg ha^{-1}	1·121
cwt ac^{-1} to kg ha^{-1}	125·5
cwt ac^{-1} to t ha^{-1}	0·1255
ton ac^{-1} to kg ha^{-1}	2511
ton ac^{-1} to t ha^{-1}	2·511
gal ac^{-1} to l ha^{-1}	11·233

The following factors are accurate to about 2 parts in 100:

1 lb ac^{-1} = 1·1 kg ha^{-1}
1 gal ac^{-1} = 11 litres ha^{-1}
1 ton ac^{-1} = 2·5 t ha^{-1}

In general reading of the text there will be no great inaccuracy in regarding:

1 lb = 0·5 kg
1 lb ac^{-1} = 1 kg ha^{-1}

Temperatures

To convert °F into °C subtract 32 and multiply by $\frac{5}{9}$ (0.556)
To convert °C into °F multiply by $\frac{9}{5}$ (1·8) and add 32

Plant nutrients

Plant nutrients are best stated in terms of amounts of the elements (P, K, Na, Ca, Mg, S); the old 'oxide' terminology (P_2O_5, K_2O, Na_2O, CaO, MgO, SO_3) is still used in work involving fertilisers and liming since Regulations require statements of P_2O_5, K_2O, etc.

For quick conversions

(accurate to within 2%) the following factors may be used:

$2\frac{1}{3} \times P = P_2O_5$	$\frac{3}{7} \times P_2O_5 = P$
$1\frac{1}{5} \times K = K_2O$	$\frac{5}{6} \times K_2O = K$
$1\frac{2}{5} \times Ca = CaO$	$\frac{7}{10} \times CaO = Ca$
$1\frac{2}{3} \times Mg = MgO$	$\frac{3}{5} \times MgO = Mg$

For accurate conversions:
