1 ton/acre =	2.5 tonnes/ha

*In general reading of the text there will be no great inaccuracy in regarding:*

1 lb =	0.5 kg.
1 lb/acre =	1 kg/ha

### Temperatures

To convert °F into °C subtract 32 and multiply by  $\frac{5}{9}$  (0.556)

To convert °C into °F multiply by  $\frac{9}{5}$  (1.8) and add 32

kg/ha to tons/acre	0.0003983
tonnes/ha to tons/acre	0.3983
litre/ha to gal/acre	0.08902

### Plant nutrients

Plant nutrients are best stated in terms of amounts of the elements (P, K, Na, Ca, Mg, S); the old 'oxide' terminology  $P_2O_5$ ,  $K_2O$ ,  $Na_2O$ ,  $CaO$ ,  $MgO$ ,  $SO_3$  is still used in work involving fertilisers and liming since Regulations require statements of  $P_2O_5$ ,  $K_2O$ , etc.

### For quick conversions

(accurate to within 2%) the following factors may be used:

$2\frac{1}{3} \times P = P_2O_5$	$\frac{3}{7} \times P_2O_5 = P$
$1\frac{1}{3} \times K = K_2O$	$\frac{5}{8} \times K_2O = K$
$1\frac{2}{5} \times Ca = CaO$	$\frac{7}{10} \times CaO = Ca$
$1\frac{2}{3} \times Mg = MgO$	$\frac{3}{5} \times MgO = Mg$

### For accurate conversions:

To convert	Multiply by	To convert	Multiply by
$P_2O_5$ to P	0.4364	P to $P_2O_5$	2.2915
$K_2O$ to K	0.8301	K to $K_2O$	1.2047

WHEAT AND THREE-COURSE ROTATION BROADBALK 1968

(BK)

The 125th year, 1st year of revised scheme

For history, treatments etc. see 'Details' 1967, Station Report for 1966, pp. 229-231 and Station Report for 1968, Part II.

Plots and sections:

The five sections created in 1926 are now all subdivided and renumbered (for details see below). Headlands adequate for turning tractors etc. separate all the new sections.

In 1968 a new plot was made, north of plot 2A. This is called plot 1 and runs the length of old sections II, III, IV only.

Cropping:

The cropping for 1968 - 1971 is as follows:-

Old section	IA	IB	II	III	IV	VA	VB
Last fallow	1951	1966	1967	1965	1964	1963	1958
New section	0	1	2 3	4 5	6 7	8	9
Crop in:							
1968	W	W	Be W	W W	F P	W	W
1969	W	W	W W	P F	W Be	W	W
1970	W	W	P F	Be W	W W	W	W
1971	W	W	Be W	W W	F P	W	W

(W = winter wheat, Be = spring beans, F = fallow, P = potatoes)

Sections 0, 1, 8, 9 will carry continuous wheat except when perennial weeds make a fallow necessary, but all four will not be fallowed in the same year. Sections 2, 4, 7 will continue in the 3-course rotation:

potatoes, spring beans, wheat.

Sections 3, 5, 6 will be cropped in a 3-year cycle:

fallow, wheat, wheat.

All sections carrying wheat will be sprayed as necessary to control weeds, except section 8 which (as hitherto) will receive no weedkiller sprays.

Section 00, soil fumigation to continuous winter wheat: In autumn 1967 a 10 ft length at the West end of every plot of section 0 was fumigated with methyl bromide at 870 lb. Resulting yields were compared with those from an adjoining 10 ft length which received normal treatments only. Both series of plots were harvested by small combine harvester.

68/A/1.2

In 1968 simazine was applied to beans, no weedkiller was applied to potatoes.

Varieties in 1968:

Wheat: Cappelle Desprez  
Beans: Maris Bead (inoculated seed)  
Potatoes: Majestic.

Manuring:

- (a) Plot 1. The new plot 1, which has received no organic or mineral manures for many years, now receives farmyard manure plus N2PK (see below for details) each year, applied to all crops including fallow (no N to fallow).
- (b) Nitrogen fertilisers. Sulphate of ammonia and nitrate of soda are discontinued, 'Nitro-Chalk' 21 being used instead. It is all applied at one time in spring.

For wheat it is applied as a top-dressing, for potatoes before rotary cultivation, for beans to the seedbed. No 'Nitro-Chalk' to fallow.

Rates of N are unchanged except on plots 2A, 9, 15 (for details see below).

The rates and symbols are (1b N), 43 (N1), 86 (N2), 129 (N3) and 172 (N4).

- (c) Organic manures. Farmyard manure (FYM) and castor bean meal are applied as hitherto, except that organics are now applied to the fallow section.

Symbol:

D: 14 tons FYM.  
R: Castor meal supplying 86 lb N.

- (d) Mineral manures. Except on plots 17 and 18 (which now receive PKNaMg at half the standard rates each year) and plot 14 which now receives K in addition to PMg, rates and materials are unchanged:-

Symbol:

P: Superphosphate supplying 30 lb P.  
K: Sulphate of potash supplying 80 lb K.  
Na: Sulphate of soda supplying 14 lb Na (except plot 12, 51 lb Na).  
Mg: Sulphate of magnesia supplying 10 lb Mg (except plot 14, 28 lb Mg).

All these are applied in autumn before ploughing. They are applied for all crops and fallow.

NOTE: Plot 20 does not run the full length and is not included in the rotation scheme.

**Liming:**

Ground chalk was applied under the old scheme in autumn 1967, the following additional applications were made: (cwt chalk)

Plot	7	8	11	13	14	15
Section						
1	-	23	-	-	-	-
6,7	-	69	23	23	-	-
8	23	23	-	23	23	23
9	23	23	-	-	-	-

(remainder : none).

New scheme: Ground chalk will be applied in every third year, starting autumn 1970.

**Drilling and planting:**

Wheat: Because of the use of a new 15 row drill the plot widths for wheat have been reduced from 36 rows (21 ft) to 30 rows (17 ft 6 ins). Plot 1 has 30 rows. Plots 2A and 2B, originally 20 rows (11 ft 8 ins) each, now have 22 rows (12 ft 10 ins) each.

68/A/1.4

Beans: 12 rows drilled (plot width 21 ft). Plot 1 has 12 rows.

Plots 2A and 2B each have 7 rows (12 ft 3 ins).

Potatoes: 8 rows are planted (plot width 18 ft 8 ins). Plot 1 has 8 rows. Plots 2A and 2B each have 5 rows (11 ft 8 ins).

The manures (with the exception of 'Nitro-Chalk') continue to be applied to the full 21 ft width for all crops. This applies also to plot 1. Dung is applied to plots 2A and 2B as though they were one plot, width 26 ft 3 ins. 'Nitro-Chalk' is applied to the drilled area for wheat, and to the full 21 ft width (13 ft on plot 2A) for beans and potatoes.

HOOSFIELD: BARLEY AND THREE-COURSE ROTATION 1968

(HB)

The 117th year, 1st year of revised scheme

For history, treatments, etc., see 'Details 1967' and Station Report for 1966.

Cropping and treatments:

A three-course rotation (potatoes, spring beans, spring barley) is now followed on parts of the old series AA, AAS and C. The remainder of these series, the old series O and A and old plots 1N, 2N, 5-0, 5A, 6-1, 6-2, 7-1, 7-2, carry continuous barley.

The arrangement is indicated below:-

Old Series	O	A	AA	AAS	C	1N,2N 5-0,5-A
(East): 1968	B	B	B P	P B	B B P Be	B (West)
1969	B	B	B Be	Be B	B P Be B	B
1970	B	B	B B	B B	B Be B P	B
1971	B	B	B P	P B	B B P Be	B

(B = Barley, Be = Beans, P = Potatoes)

Varieties in 1968:

Barley - Maris Badger, Beans - Maris Bead (seed inoculated with Rhizobium), Potatoes - Majestic.

The strip manures:

- Strip 1 - None
- 2 - P
- 3 - KNaMg
- 4 - PKNaMg

continue to be applied at the same rates, but are now applied in autumn before ploughing. Farmyard manure (D) at 14 tons is applied to plot 7-2 as hitherto and silicate of soda is applied as hitherto (old series AAS). The rate is unchanged but it too is applied before ploughing. Castor meal is no longer applied. All plots (except 1N, 2N, 5-0, 5A) are split into 4 sub plots and (except on plot 7-2) a test is made of none (N0), 43(N1), 86(N2), 129 (N3) lb N as 'Nitro-Chalk 21' applied to the barley seed bed. Potatoes receive basal 'Nitro-Chalk' at 129 lb N before rotary cultivation in spring, beans receive no N. The levels of N to barley are cumulative and are randomized. Plot 7-2 in 1968 had a test on duplicate sub plots of N0 and N1\*\*. Plots

68/A/2.2

1N (now numbered 581), 2N (571), 5A (551), receive N2, plot 5-0 (561) NO. Plots 5-0, and 5A receive PK, at rates as before but applied before ploughing in autumn.

\* NOTE: In 1968 sub plots on the old plots 6-1, 6-2, 7-1 and 7-2 received nitrogen at rates 57 (N1) 115 (N2) and 172 (N3) lb N in error.

Symbols:

D - 14 tons farmyard manure  
P - Superphosphate supplying 30 lb P  
K - Sulphate of potash supplying 80 lb K  
Na - Sulphate of soda supplying 14 lb Na  
Mg - Sulphate of magnesia supplying 10 lb Mg  
Si - 400 lb silicate of soda.

Standard applications 1968:

To Barley: (weedkiller) dicamba/mecoprop/MCPA ('Banlene Plus' at 4 pints in 33 gals).  
To Beans: (weedkiller) simazine at 1 lb in 33 gals, (insecticide) phorate at 1.04 lb (in granules).  
To Potatoes: (no weedkiller) (fungicide) mancozeb at 1.2 lb in 37 gals, on 3 occasions, (insecticide) demeton-s-methyl at 3.5 oz applied with fungicide on 2nd occasion, (haulm killer) undiluted BCV at 20 gals.

Liming:

Under the new scheme ground chalk will be applied every third year, starting Autumn 1970.

Area of each sub plot:-

	Area	Area harvested
Old series O and A	0.0317	0.0086
Old plots 6-1, 6-2, 7-1 and 7-2	0.0238	0.0064
Old series AA, AAS and C		
Barley	0.0087	0.0024
Potatoes	0.0087	0.0047
Beans	0.0087	0.0044**
Old plots 1N, 2N, 5-0, 5A (whole plots)	0.0661	0.0101

Barley is harvested by small combine harvester on the old series AA, AAS and C, by large combine on the remainder.

\*\* Plots harvested in pairs.

All crop-rows now run north-south, not east-west as previously.

(HWF)

For history, treatments, etc. see 'Details' 1967.

Area of each plot: 0.1237. Area harvested: 0.0366.

The seed is now treated with a seed-dressing (dieltrin 1967 and 1968) to control wheat bulb fly (*Leptohylemyia coarctata*).

Cultivations, etc.:

Cropped plots: Ploughed: 5 Sept, 1967. Seed drilled at 180 lb:  
19 Oct. Sprayed with ioxynil at 9 oz and mecoprop at 27 oz in  
20 gals: 14 May, 1968. Combine harvested: 26 Aug.

Fallow plots: Ploughed 3 times: 5 Sept, 1967, 27 May and

BARNFIELD: FOUR-COURSE ROTATION AND SPRING BEANS AFTER LONG TERM

EXPERIMENTS ON ROOT CROPS

(BN)

First year of new scheme, 1968

For history, treatments, etc., see 'Details 1967' and 'Results' 62/A/5.

Cropping and design:

Series O (now Section 1): Continuous spring beans started 1967. Plots are split lengthways into two for a test (unrandomised) of inter-row cultivation none (O) v. 1 (H) lb simazine lb simazine for weed control.

The valley (now Section 2), excluding a 30 ft headland between the valley and section 3: As section 1. The remainder of each strip (1, 2, 4, 5, 6, 7, 8,) is split lengthways into two to carry two crops of a four course rotation of potatoes, spring barley, sugar beet and spring wheat, with two crops present each year (barley and wheat in 1968, with barley on the east side, both following beans 1967). Each half is further split breadthways into two for the 4 N rates, which are applied cumulatively (for rates of N see below). Each whole plot has the four rates, NO and N2 on one crop, N1 and N3 on the other.

In each crop on any one strip Series N and C have the same two rates of N, Series A and AC the other two. In each crop, too, on any one series, strips 1, 4, and 5 have the same two rates of N and strips 2, 6, 7, and 8, the other two. Series N, A, AC, and C are now called Sections 3, 4, 5 and 6 respectively.

Plot 9: Carries a four course rotation as above with one crop present each year (barley in 1968). It is similarly divided into quarter plots to which the 4 rates of N are applied for each crop.

Manuring:

Nitrogen is now applied as 'Nitro-Chalk' only. The rates in lb N are none (NO), 43 (N1), 86 (N2), 129 (N3) to barley and wheat and none (NO), 64 (N1), 129 (N2) and 193 (N3) to potatoes and sugar beet. No N is applied to beans. The mineral fertilisers and FYM to strips continue to be applied. Section 2 (the valley) now receives the strip manures. Application of castor bean meal is discontinued.

68/A/5.2

Varieties in 1968: Barley: Maris Badger, spring wheat: Kolibri,  
spring beans: Maris Bead (uninoculated).

Plot areas:

Wheat and barley (quarter plot):  
0.0362 (Strip 1: 0.0238). Area harvested: 0.0193.  
Beans Section 1 (half plot): 0.0723

Section 2 (half plot): 0.0241.  
(Strips 1 and 8: 0.0158). Area harvested: 0.0129.

Cultivations, etc.:— P, K, Na and Mg applied: 22 Sept, 1967. Sub-  
soiled: 10 Oct. FYM applied, all plots ploughed: 9 Nov.  
Spring wheat: Seed drilled at 160 lb: 4 Mar, 1968. 'Nitro-Chalk'  
applied: 18 Mar. Combine harvested: 7 Sept.  
Barley: Seed drilled at 140 lb: 4 Mar, 1968. 'Nitro-Chalk'  
applied: 18 Mar. Combine harvested: 22 Aug.  
Spring beans: Seed drilled at 200 lb: 4 Mar, 1968. Half plots  
sprayed with simazine at 1 lb in 33 gals: 5 Mar. 1.04 lb  
phorate applied in granules: 21 June. Combine harvested:  
9 Sept.

NOTE: Birds took much of the grain from the plots of strip 1.

(EGC)

The 115th year

(Revised 1968)

For history etc., see 'Details' 1967.

Basal applications: 0.6 cwt P205, 1.2 cwt K20 applied as (0:14:28) in winter 0.6 cwt K20 as muriate of potash after each cut except the last.

Test of N x Mg: The test of 0 (NO) v 1.0 (N1) cwt N per cut introduced in 1967 is continued. A further test of 0 (MgO) v 100 (Mg1) lb Mg as sulphate of magnesia ( $MgSO_4 \cdot 7H_2O$ ) is applied to quarter plots (50 lb Mg in winter and 50 lb after the 1st cut).

Variety: S123.

Cultivations, etc.: Basal PK and test Mg applied: 24 Jan, 1968. Area hand weeded: 27 Feb. All plants removed and carted, area hand hoed: 12 Mar. Area raked down to seedbed, seed sown at 30 lb, 'Nitro-Chalk' applied: 29 Mar. Cut, basal potash, test Mg and 'Nitro-Chalk' applied: 12 Aug. Cut second time: 17 Oct.

NOTE: Yields were not recorded from NOMgO and N1MgO plots for the 1st cut because of rabbit damage.

## LEY AND ARABLE ROTATIONS

(HLA and FLA)

Highfield and Fosters Field 1968, the 20th year.

For details of treatments, rotations, etc. see 'Details' and 'Results' 63/B/1, 64/B/1, 65/B/1, 66/B/1 and 67/B/1.

Revised cropping: From 1968 the sequence of test crops has been changed to potatoes, winter wheat, barley. This new sequence started on blocks 6 and 7 (Highfield) and blocks 8 and 9 (Fosters). Apart from blocks 1 - 4 on each field, which are retained in the three year cycles of treatment and test crops, no further treatment sequences will be started. After three test crops, blocks will be sown to winter wheat each year. This scheme started on blocks 5 and 8 (Highfield) and blocks 5 and 7 (Fosters). Apart from blocks 1 - 4 on each field, old and reseeded grass is now ploughed up for test cropping as blocks enter either 1st or 4th test crop phase.

Manures to 1st test crop, potatoes:-

N to 1/8th plots: None (NO), 0.6 (N1), 1.2 (N2), 1.8 (N3) cwt as 'Nitro-Chalk' shortly before planting.

P205 to 1/16th plots (in cwt):

Sub plots without FYM (F): 1.95 (P0) v 2.85 (P1)

Sub plots with FYM (D): 1.50 (P0) v 2.40 (P1)

NOTE: In 1968 because of an excess application to Fosters Field the rates were revised for both fields as follows:

F sub plots: 2.85 (P0) v 3.75 (P1)

D sub plots: 2.40 (P0) v 3.30 (P1)

K20 to 1/16th plots (in cwt):

Sub plots without FYM (F): 1.80 (K0) v 2.70 (K1)

Sub plots with FYM (D): 0.90 (K0) v 1.80 (K1)

FYM to 1/4 plots: None (F) v 12 tons (D) applied on the plough furrow and rotary cultivated in. No FYM is applied to the R and G plots coming into potatoes in 1968 and 1969, these plots being treated as F plots.

P and K are applied as superphosphate and muriate of potash except the 'dung equivalent' P and K (0.45 cwt P205 and 0.90 K20) which is compound fertiliser (0:14:28). All are applied on the plough furrow and rotary cultivated in.

68/B/1.2

Corrective K dressings to 1st test crop potatoes designed to bring the K levels on both fields to that of the Fosters LC plots, were ploughed in as muriate of potash in autumn 1967 as follows (in cwt):-

Rotation	Fosters	Highfield
AH	5.5	6.7
Lu	3.8	4.8
LC	None	0.6
LN	2.9	4.4
RC	None	None
RN	3.5	3.5
GC	None	None
GN	None	3.5

NPK dressings to 4th test crop, winter wheat:-

Basal dressing: 0.9 cwt P2O<sub>5</sub>, 0.9 cwt K<sub>2</sub>O as compound fertiliser (0:20:20) half combine drilled, half by hand.

Test nitrogen to 1/8th plots:

Highfield (all rotations): 0.3 (N1), 0.6 (N2), 0.9 (N3), 1.2 (N4) cwt N as 'Nitro-Chalk' in spring.

Fosters (all rotations): 0.4 (N1), 0.8 (N2), 1.2 (N3), 1.6 (N4) cwt N as 'Nitro-Chalk' in spring.

Varieties:

Potatoes, 1st Test Crop: King Edward

2nd Test Crop: Majestic

Barley, 3rd Test Crop: Maris Badger

Winter wheat, 4th Test Crop: Cappelle

Sugar Beet, 2nd Treatment Crop: Klein E

Oats, 3rd Treatment Crop: Manod

NOTE: Highfield: The fourth test crop wheat was severely attacked by take-all (*Ophiobolus graminis*) on both blocks, especially wheat after lucerne and arable rotations. The wheat on the 2 plots ploughed in autumn 1967 from old grass was badly damaged by wireworms (*Agriotes* spp.), wheat flea beetle larvae (genus *Phyllotreta*), and unidentified stem boring larvae.

CULTIVATION - WEEDKILLER ROTATION

(CW)

Great Harpenden I 1968 - the 8th year

A comparison of weed-control by various cultivation methods and by pre-emergence weedkillers.

For previous history, rotations, treatments etc., see 'Results' 61/B/10, 62/B/10, 63/B/10, 64/B/9, 65/B/8, 66/B/7 and 'Details' 1967.

A comparison is now made of none v paraquat (G) applied to stubbles after beans, wheat and barley. This is made on half-plots, in all combinations with the test of O v H (post-emergence weedkiller to wheat and barley). The interaction (O v G) x (O v H) is confounded with blocks. Both tests are cumulative, except that in certain years H has been applied to all sub-plots. The first application of paraquat was in autumn 1967, at 0.75 lb ion in 32 gals.

NOTE: As in 1967 A and B plots after potatoes before barley received spring-tine cultivation and no other cultivations.

Area harvested: Beans - 0.0121, wheat, potatoes and barley - 0.0107.

Basal dressing to winter wheat: 2.5 cwt (6:15:15) combine drilled and 3 cwt 'Nitro-Chalk' in spring. All other crops as 1967.

Ground chalk: Spring beans - 23 cwt, winter wheat and potatoes - 46 cwt, barley - 92 cwt.

Cultivations, etc.:-

Spring beans: Paraquat applied to G sub-plots: 12 Oct, 1967. Ground chalk applied: 23 Nov. T plots deep-tine cultivated twice and B plots once: 24 Nov. P and C plots ploughed: 27 Nov. R plots rotary cultivated, depth 6 ins: 6 Dec. P,R,T, B and C plots spring-tine cultivated: 1 Mar, 1968. P,R, T and C plots spring-tine cultivated: 4 Mar. A plots rotary cultivated, seed drilled at 200 lb: 5 Mar. S plots sprayed: 8 Mar. M and C plots tractor-hoed three times: 26 Apr, 20 May and 31 May. Combine harvested: 11 Sept. Variety: Maris Bead.

Winter wheat: Paraquat applied to G sub-plots: 12 Oct, 1967. Ground chalk applied: 23 Nov. T plots deep-tine cultivated twice: 24 Nov. P, C and A plots ploughed: 27 Nov. P,T,A, B and C plots spring-tine cultivated twice, R plots rotary

cultivated, seed drilled at 190 lb: 5 Dec. All plots harrowed: 25 Mar, 1968. 'Nitro-Chalk' applied: 12 Apr. H sub-plots and B plots sprayed with mecoprop at 42 oz and 2,4-D at 10.5 oz in 33 gals: 4 May. Combine harvested: 25 Aug. Variety: Cappelle.

Potatoes: Paraquat applied to G sub-plots: 12 Oct, 1967. Ground chalk applied: 23 Nov. T plots deep-tine cultivated twice: 24 Nov. P and C plots ploughed: 27 Nov. R plots rotary cultivated, depth 6 ins: 5 Dec. Basal compound fertiliser applied: 13 Mar, 1968. T plots deep-tine cultivated, P,C and R plots spring-tine cultivated (R plots in error), R plots rotary cultivated, P,C and T plots spring-tine cultivated. A and B plots rotary cultivated, potatoes machine planted: 29 Mar. M and C plots chain harrowed: 26 Apr. S plots sprayed: 3 May. M and C plots grubbed: 20 May, mechanically weeded: 24 May, rotary ridged: 28 May. M, C and Y plots grubbed: 7 June. M, C and Y plots rotary ridged: 12 June. All plots sprayed 3 times with mancozeb at 1.2 lb in 37 gals (the second time including demeton-s-methyl at 3.5 oz): 4 July, 19 July, 5 Aug. Sprayed with undiluted BOV at 15 gals: 30 Aug. Haulm destroyed mechanically 13 Sept. Lifted: 1 Oct.

Barley: All plots spring-tine cultivated twice and sprayed twice with sodium trichloroacetate at 18 lb in 32 gals: 28 Sept and 25 Oct, 1967. All plots spring-tine cultivated: 17 Nov. T plots deep-tine cultivated twice: 24 Nov. Ground chalk applied: 7 Dec. P and C plots ploughed, R plots rotary cultivated, depth 4 - 5 ins: 20 Dec. All plots spring-tine cultivated, seed drilled at 140 lb: 1 Mar, 1968. All plots rolled: 13 Mar. H sub-plots and B plots sprayed with mecoprop at 36 oz and 2,4-D at 9 oz in 33 gals: 4 May. Table 1. Summary of the results of the 2010-2011 survey of the status of the world's coral reefs. The table shows the number of reefs in each of the four categories of health (Good, Fair, Poor, and Very Poor) and the percentage of reefs in each category. The total number of reefs surveyed is 1,000.

Woburn Stackyard III 1968, 1st year.

Design: 6 blocks of 6 plots, split into two. Half plots received  
uniform treatment in 1968 but later there will be a test of  
phosphate.

Area of each sub plot: 0.0167. Area harvested: 0.0111.

Treatments: Superphosphate: None (R0) (2 plots per block), 1.5 (R1),  
3.0 (R2), 6.0 (R4), 9.0 (R6) cwt P<sub>2</sub>O<sub>5</sub> as superphosphate.

Basal applications: Both crops: 5 cwt K<sub>2</sub>O as sulphate of potash,  
2.0 cwt MgO as Epsom salts in August 1967.

Potatoes: 2.0 cwt N as 'Nitro-Chalk' and 1.5 cwt K<sub>2</sub>O as sulphate  
of potash in spring. Weedkiller: Linuron at 0.5 lb plus  
paraquat at 0.37 lb ion in 50 gals. Fungicide: Mancozeb at  
1.2 lb in 38 gals. Insecticide: Demeton-s-methyl at 3.5 oz  
in 38 gals.

Barley: 23 cwt ground chalk. 1.2 cwt N as 'Nitro-Chalk' and 0.5  
cwt K<sub>2</sub>O as muriate of potash in spring. Weedkiller:

Cultivations, etc.: Both crops: Rotary cultivated: 13 June, 1967.

Subsoiled: 20 - 21 June, 30 June - 3 July, 3 - 4 July (3  
directions). Deep-tine cultivated: 6 July. Basal K and Mg  
applied: 9 Aug. Phosphate treatments applied: 15 - 16 Aug.

Fallow since 1963 (the site was part of the site of the Woburn  
Classical Experiments).

Potatoes: 'Nitro-Chalk' applied: 18 Mar, 1968. Sulphate of  
potash applied: 19 Mar. Rotary cultivated, potatoes planted:  
27 Mar. Weedkiller applied: 3 May. Rotary ridged: 13 June.  
Fungicide and insecticide applied: 12 July, 24 July.  
Fungicide applied: 30 July. Sprayed with undiluted BOV at  
15 gals: 4 Sept. Lifted: 25 Sept. Variety: Majestic.

68/B/8.2

Barley: Ground chalk applied: 11 Dec, 1967. 'Nitro-Chalk'  
applied, spring-tine cultivated: 4 Mar, 1968. Muriate  
of potash applied, seed drilled at 140 lb: 6 Mar. Weedkiller  
applied: 3 May. Combine harvested: 20 Aug. Variety: Maris  
Badger.

Standard errors per plot.

Potatoes: Total tubers: Whole plot: 0.478 or 3.8% (10 d.f.)

Nitrogen fixation by lucerne - Rothamsted (R) Stackyard and Woburn (W) Stackyard C 1968, the second year. For treatments etc. and for the previous year's results see 'Results' 67/c/33.

In 1968 the nitrogen treatments were none (N0), 30 (N1), 60 (N2), 90 (N3) lb N as 'Nitro-Chalk' applied for every cut.

Cultivations, etc.:-

Stackyard (R): PK and first 'Nitro-Chalk' dressings applied: 22 Mar, 1968. Cut 4 times: 15 May, 2 July, 12 Aug and 30 Sept. 'Nitro-Chalk' applied after first 3 cuts.

Stackyard C (W): PK and first 'Nitro-Chalk' dressings applied: 25 Mar, 1968. Cut twice: 20 May, 3 July. 'Nitro-Chalk' applied after each cut.

- NOTES: (1) An error was made in applying the N dressings after the second cut on Stackyard C (W) and the experiment was therefore discontinued.  
(2) Soil samples were taken on 2 Feb, 1968 for counts of *Rhizobium leguminosarum*.

BARLEY

(CP/1)

P, K and take-all (*Ophiobolus graminis*), West Barnfield II 1968, the first year.

Design: 4 randomised blocks of 10 plots.

Area of each plot: 0.0265. Area harvested: 0.0140.

Treatments: All combinations of:-

1. Phosphate (in cwt P<sub>2</sub>O<sub>5</sub> as superphosphate). Applied annually to seedbed: None (P0), 0.3 (P1), 1.2 (P4). Applied in autumn 1967 only, half before ploughing, half after: 1.8 (P6), 7.2 (P24).
2. Potash, applied annually to seedbed: 0.3 (K1), 1.2 (K4) cwt K<sub>2</sub>O as muriate of potash.

Basal applications: 0.8 cwt N as 'Nitro-Chalk' to seedbed. Weedkillers: Aminotriazole at 4 lb and ammonium thiocyanate at 3.7 lb in 32 gals. Paraquat at 0.75 lb ion in 32 gals.

Cultivations, etc.: Aminotriazole and ammonium thiocyanate applied: 21 Sept, 1967. Paraquat applied: 6 Oct. Half autumn superphosphate applied: 20 Oct. Ploughed: 26 Oct. Half autumn superphosphate applied: 7 Nov. 'Nitro-Chalk' applied: 29 Feb, 1968. Seedbed P and K applied, seed drilled at 140 lb: 1 Mar. Combine harvested: 21 Aug. Variety: Maris Badger. Previous crops: Grass 1966, winter wheat 1967.

NOTE: Estimates of eyespot (*Cercospora herpotrichoides*) and take-all (*Ophiobolus graminis*) were made in spring and summer. Estimates of lodging were also made.

Standard error per plot.

Grain: 1.26 or 3.9% (27 d.f.)

The table is extremely faint and blurry, making the data points and headers unreadable. It appears to have several columns and rows, with some horizontal lines separating sections of the data. The overall appearance is that of a scanned document with very low contrast.

Nitrogen fixation by lucerne - Rothamsted (R) Pastures and Woburn (W) Stackyard B, 1968, the first year.

Design: 4 blocks of 4 plots split into 4 for minerals and nitrogen with certain high order interactions confounded with blocks.

Area of each sub-plot: 0.0011. Area harvested: 0.0006.

Treatments: All combinations of:-

- Whole plots: 1. Seed: Lucerne uninoculated (O), lucerne with ineffective inoculum (I), lucerne with effective inoculum (E), Italian ryegrass (G).
- Sub-plots: 2. Minerals: Unmanured (U), 0.6 cwt P<sub>2</sub>O<sub>5</sub>, 1.2 cwt K<sub>2</sub>O as compound fertiliser (0:14:28), plus 4 tons of ground chalk (3 tons on Stackyard B (W)) (M).
3. Nitrogen as 'Nitro-Chalk': None (NO), 30 (N1), 60 (N2), 90 (N3) lb N in the seedbed and after each cut except the last.

Basal applications (Pastures (R) only): Weedkiller: Paraquat at 0.75 lb ion in 37 gals.

Cultivations, etc.:-

- Pastures (R): Weedkiller applied: 3 Oct, 1967. Ploughed: 29 Oct.  
PK, ground chalk and seedbed 'Nitro-Chalk' applied: 28 Mar, 1968.  
Seed drilled, lucerne at 12 lb, ryegrass at 30 lb: 1 Apr.  
Cut 3 times: 18 July, 26 Aug, 16 Oct. 'Nitro-Chalk' applied after first 2 cuts. Varieties: Lucerne - Du Puits, ryegrass - S22.
- Stackyard B (W): Subsoiled: 27 Sept, 1967. Ploughed: 11 Oct.  
PK, ground chalk and seedbed 'Nitro-Chalk' applied: 26 Mar, 1968.  
Seed drilled, lucerne at 12 lb, ryegrass at 30 lb: 27 Mar. Seed re-drilled at same rates because of poor establishment of first drilling: 26 Apr. Cut 3 times: 23 July, 30 Aug, 24 Oct.  
'Nitro-Chalk' applied after first 2 cuts. Varieties: Lucerne - Du Puits, ryegrass - S22.

- NOTES: (1) Soil samples were taken before sowing to determine pH and for counts of *Rhizobium leguminosarum*.
- (2) On Stackyard Series B (W) there was flooding of the experiment at the end of April and beginning of May, and also in September.

(WMAM)

Economic row and planting-station fumigation for control of potato cyst-nematode - Woburn Butt Furlong 1968 second year.

Design: 3 randomised blocks of 5 plots.

Area of each plot: 0.0024. Area harvested: 0.0024.

### Treatments:

Fumigants: DD: None (D0), 56(D1), 112 (D2), 224 (D4), 448 lb (D8) (DH in 1967) placed in the row at base of ridge. (Treatments D0, D1, D2, D4 cumulative with 1967).

Basal applications: Magnesian limestone 4.5 cwt. 10.5 cwt (13:13:20) side placed. Weedkiller: Paraquat at 0.38 lb plus linuron at 0.5 lb in 50 gals. Insecticide: Menazon at 0.25 lb in 50 gals. Fungicide: Mancozeb at 1.2 lb in 38 gals applied on 2 occasions.

Cultivations, etc.: Ploughed: 2 Oct, 1967. Magnesian limestone applied: 25 Oct. Deep-tine cultivated: 10 Nov. Ridged: 6 Mar, 1968. DD applied at centre of base of ridge, re-ridged: 7 Mar. Rolled: 11 Mar. NPK applied, potatoes planted: 25 Apr. Weedkiller applied: 2 May. Insecticide applied: 18 June. Fungicide applied: 18 July, 30 July. Sprayed with undiluted BOV at 15 gals: 4 Sept. Lifted: 13 Sept. Variety: Majestic.

NOTES: (1). Soil samples were taken for nematode counts in March before fumigating, and again in April before planting.

Treatments:

Whole plots: Treatments to spring beans 1967:

1. Method of application of N: Broadcast as 'Nitro-Chalk' with PK placed as compound (0:20:20) (B), 1 cwt N placed in compound (25:10:10), remainder broadcast as 'Nitro-Chalk' (P).
2. Levels of N: 1 (R1), 2 (R2), 3 (R3) cwt N.

Also 3 plots per block with no N (0).

Sub plots: N to winter wheat 1968:-

3. None (N0), 0.5 (N1), 1.0 (N2) cwt N as 'Nitro-Chalk'.

Basal applications: 340 lb (0:14:28) combine drilled. Weedkiller: Paraquat at 1 lb ion in 32 gals. Ioxynil at 9 oz and mecoprop at 27 oz in 20 gals.

Treatments: All combinations of:-

Whole plots\*: 1. Oats 1966: Under oats till harvest (O) (previously C, D, E, 3 plots per block). Oats rotary cultivated 26 May, 1966 and then bare fallowed (A). Oats rotary cultivated 26 May, 1966, bare fallowed, injected with DD at 400 lb 19 Dec, 1966 (B).

3. Nitrogen to barley 1968 cumulative on 1967: 0.4 (N1), 0.8 (N2), 1.2 (N3) cwt N as 'Nitro-Chalk'.

\* NOTE: Because of a severe invasion of grain aphid (*Sitobion avenae*) a test 0.4 lb dimethoate in 30 gals (S) was made on spring wheat. Two of the 3 (O) plots, in each block, and the A and B plots, were sprayed.

Basal applications: Wheat and barley: Weedkiller: Aminotriazole at 4 lb plus ammonium thiocyanate at 3.7 lb in 33 gals. Magnesian limestone at 22.5 cwt. 280 lb (0:20:20) combine drilled. Weedkiller: Ioxynil/mecoprop (Actril C at 5 pts in 25 gals).

Cultivations, etc.:-

Aminotriazole plus ammonium thiocyanate applied, subsoiled: 21 Sept, 1967. Magnesian limestone applied: 18 Oct. Ploughed: 11 Nov. Seed combine drilled, wheat at 170 lb, barley at 140 lb: 5 Mar, 1968. The effect of B-Nine\*, irrigation, nitrogen and its time of application on the yield and growth of spring beans - Woburn Butt Close Series II, 1968.

Design: 3 replicates of 2 x 2 x 4 in 6 blocks of 2 whole plots split into 2 and further split into 2.

Area of each sub plot: 0.0121. Area harvested: 0.0064.

Treatments: All combinations of:-

- Whole plots: 1. Irrigation: None (O), full irrigation (C).  
Half plots: 2. B-Nine\*: None (O), B-Nine at 5 lb in 35 gals at four leaf stage, and three weeks later (S).  
Quarter plots: 3. Nitrogen: None (O), 1.5 cwt N in the seedbed (E), 1.5 cwt N in late May (L), 1.5 cwt N in the seedbed, 1.5 cwt N in late May (EL), N as 'Nitro-Chalk'.

\* (N-dimethylaminosuccinamic acid).

Basal applications: 360 lb (0:14:28) placed. Weedkiller: Simazine at 0.75 lb in 33 gals. Insecticide: Demeton-s-methyl at 3.5 oz in 37 gals. Magnesian limestone at 22.5 cwt.

Cultivations, etc.: Ploughed: 19 Sept, 1967. Magnesian limestone applied: 25 Oct. Deep-tine cultivated: 26 Oct, 10 Nov. 'Nitro-Chalk' applied to E and EL plots, seed drilled at 200 lb: 28 Feb, 1968. Weedkiller applied: 1 Mar. B-Nine applied: 15 May. 'Nitro-Chalk' applied to L and EL plots: 29 May. B-Nine applied: 5 June. Insecticide applied: 13 June. C plots irrigation applied at 0.5 inches: 14 June, 0.75 inches: 20 July. Combine harvested: 13 Sept. Variety: Tarvin. Previous crops: Spring wheat 1967, potatoes 1966.

- NOTES: (1) Germination counts were made and scores made for nodulation and root growth. Stem and pod counts were made and stem height measured.  
(2) 1000 grain wts. and percentage N in the grain were taken.  
(3) Counts of free living nematodes were taken after harvest.  
(4) After the first application of B-Nine there was evidence of weedkiller damage from residues left in the sprayer, most severe on the first plots sprayed. Because of this the first two half plots sprayed were treated as missing plots and estimated values used in the analysis.

Standard error per plot (pooled).

TABLE 1

(a) Weighted average of the three measures of the extent of the problem (the mean of the three measures) is shown in the first column. The second column shows the number of species in the problem. The third column shows the number of species in the problem that are listed as threatened or endangered. The fourth column shows the number of species in the problem that are listed as endangered. The fifth column shows the number of species in the problem that are listed as critically endangered. The sixth column shows the number of species in the problem that are listed as vulnerable. The seventh column shows the number of species in the problem that are listed as near threatened. The eighth column shows the number of species in the problem that are listed as least concern.
