YIELDS of the FIELD EXPERIMENTS 1980

This report is produced by members of the Statistics Department and of the Field Experiments Section. It includes only experiments conducted at Rothamsted, Woburn and Saxmundham. Only those experiments which have the determination of crop yields as an object are included. For many of these, other determinations are of equal or greater importance.

CONVENTIONS 1980

For each experiment current treatments are shown, together with the factor and level names which are used in the tables. The program used for the analyses of these experiments limits level names to eight characters, and factor names similarly, though a suffix of up to 3 digits in brackets may be appended if required.

For each experiment, other than annuals, references are given to previous years. These refer to the '(Numerical)(Results) Yields of the Field Experiments' - (t) indicates a year when treatments were described. Since 1973 treatments have been described annually for all experiments and (t) is not used for these years.

For the classical and some long-term experiments reference is made to 'Details' - separate publications, giving full descriptions of treatments until 1967 & 1973, with full titles 'Details of the Classical and Long Term Experiments up to 1967' and 'Details of the Classical and Long Term Experiments up to 1973'.

The following conventions are observed unless otherwise stated.

All areas are in hectares. All plot dimensions are in metres.

All seed rates, rates of application of fertilisers, sprays etc. are per hectare.

All yields and plant numbers are per hectare.

The following abbreviations are used in variate headings:

Wheat, barley, oats, beans etc.

Grain:	Grain (at 85% dry matter)
Straw:	Straw (at 85% dry matter)

Sugar beet

Roots:	Roots (washed)
Sugar %:	Sugar percentage

All crops

Mean D.M. %:	Mean dry matter % as harvested

For any other crop, details of abbreviations are given as necessary.

'Nitro-Chalk' refers to the grade containing 26% N unless otherwise stated.

Compound fertilisers indicated thus - (20:10:10) = compound fertiliser (20% N, 10% P_2O_5, 10% K_2O), granular unless otherwise stated.

The compound fertiliser (13:13:20) used in our experiments is the grade containing sulphate of potash.

Treatment of cereal seed with organomercury and/or gamma HCH should be assumed in this report, exceptions are noted.

https://doi.org/10.23637/ERADOC-1-31 *pp 8*

Harvest areas for cereals

On most of those cereal experiments at Rothamsted and Woburn (but not Saxmundham) which are harvested by combine the 'blank-row' technique is used to distinguish the areas taken for yield from the discard areas. When seed is drilled in rows 7 in. (18 cm.) apart (the most common arrangement), appropriate coulters are prevented from sowing and 8 or 16 rows are left for yield according to the cutter-bar width of the combine to be used. If the row-spacing is other than 7 in. a similar arrangement is used but with a different number of rows.

The ends of plots are separated from each other or from headlands by 3 ft (91 cm.) fallow paths made after the crop has established.

The 'Area harvested' in the 'Yields', when the blank-row technique is used, is the product:-

number of rows harvested x distance between rows x length of rows.

A series of experiments at Rothamsted showed that on average the yield of 16 rows (50 ft (15 m) long) was 7.8% greater with blank rows than without. (Experimental Husbandry 23 pp 16-20 (1972)).

If no rows are left blank and the plot is wider than the combine harvester so that discards are left uncut, the 'Area harvested' is the product:-

width of cutter bar x length of rows.

If the plot is narrower than the combine so that the whole area between paths is cut, the 'Area harvested' is the product:-

number of rows x distance between rows x length of rows.

We do not apply the adjustment used by some workers who take the harvested areas as width x length where each is measured to the centre of 'paths' up to a maximum of 18 in (46 cm).

Tables of means

Tables of means are presented directly from computer output. Both factor and level names are present in upper case characters. Vertical and horizontal lines are omitted e.g.:-

FACTOR C	LEVEL C1		LEVEL C2		LEVEL C3	
FACTOR B	LEVEL B1	LEVEL B2	LEVEL B1	LEVEL B2	LEVEL B1	LEVEL B2
FACTOR A						
LEVEL A1	*	*	*	*	*	*

Standard errors

NOTES: (1) This report gives standard errors of differences, not of means.

(2) Annotations (e.g. * min rep, max-min, max rep) to S.E.Ds are only explained the first time they occur in any experiment.

Object: To study the effects of organic and inorganic manures on continuous spring barley. From 1968 to 1978 a rotation of potatoes, beans and barley was practised. The rotation was discontinued in 1979 and the experiment reverted to continuous barley.

The 129th year, s. barley.

For previous years see 'Details' 1967 & 1973, Station Report for 1966 and 74-79/R/HB/2.

ROTATION I

Object: To compare nutrient cycles, uptakes of nutrients and responses to fresh P and K. To obtain an estimate of the rate of release of nutrients, particularly K, from Saxmundham soil - Saxmundham.

Sponsor: A.E. Johnston.

The 82nd year, grass, w. wheat, s. barley and potatoes.

For previous years see 'Details' 1967 & 1973, and 74-79/S/RN/1.

Whole plot dimensions (new treatments): 5.49 x 17.1.

Treatments: From 1899 to 1969 the experiment followed a four-course rotation of w. wheat, roots, s. barley, legumes. Each phase of the rotation was present each year on a separate block. From 1966 each plot was divided, a small area at the south end being continued under the original treatment until 1979 (OLDTREAT), modified treatments (NEWTREAT) being applied on the larger sub-plots (see below).

In 1970 the rotation was stopped and each pair of blocks was divided for lucerne and grass (the OLDTREAT sub-plots form a part of the Grass area). In 1977 lucerne was ploughed on one pair of blocks to start an arable rotation and in 1978 lucerne on the other blocks was replaced by a grass/clover mixture. The grass/clover mixture was ploughed in 1979 for a test of subsoiling. Remaining treatments to grass in 1980 were:

80/S/RN/1

NOTES: (1) For a fuller record of treatments see 'Details' etc.
(2) On OLDTREAT grass, clover appeared naturally on some plots in 1975. To unify the plots white clover was sown on all at 33 kg.
(3) From 1980 treatments have not been applied to OLDTREAT grass and yields have not been taken.

The pair of blocks in arable crops since 1977 are divided into three for three phases of the four-course rotation w. barley, potatoes, beans, w. wheat. Whole plot treatments are continued as for NEWTREAT grass except w. beans are not given N and plots previously given farmyard manure now receive phosphate fertiliser. Plots on this area are randomly subdivided for each crop for a test of potash fertiliser. All combinations of the following are present (on w. wheat, w. barley and potatoes in 1980):-

The pair of blocks testing subsoiling (in s. barley 1980) had all combinations of:

2. TREATMNT

CNVNTIAL	Conventional, mouldboard ploughed on 30 May, 1979

NOTE: W. wheat was sown on the subsoiling test section but was severely damaged by wheat bulb fly. The area was rotary cultivated in April and s. barley was sown.

ROTATION II

Object: To measure, by crop yields and soil analysis, the residual value of P applied as FYM or superphosphate in the periods 1899-1964 and 1965-1967 and of fresh dressings since - Saxmundham.

Sponsors: G.E.G. Mattingly, A.E. Johnston.

The eleventh year of revised scheme, w. wheat, w. beans.

For previous years see 'Details' 1967 & 1973, and 74-79/S/RN/2.

Whole plot dimensions: 5.49 x 39.8.

Treatments: From 1899-1964 the experiment tested farmyard manure and nitrogen and phosphate fertilisers applied to a rotation of crops. Since 1965 the treatments have been changed to evaluate old residues of P (from FYM and superphosphate) and new residues from treatments applied 1965-1967. All crops of the rotation - potatoes, s. barley, sugar beet, s. barley - were grown until 1974. The whole experiment was sown to s. barley in 1975 and 1976, alternating w. wheat and s. barley from 1977 to 1979, w. beans and w. wheat in 1980. Combinations of the following treatments are tested:

LEY ARABLE

Object: To study the effects of three-year leys on the fertility of the soil as measured by a sequence of three arable test crops. From 1968, continuous w. wheat was grown on some blocks after the three test crops to study the build-up and decline of take-all (Gaeumannomyces graminis) after the different cropping sequences. From 1977 new crop sequences were introduced on these blocks - Highfield and Fosters.

Sponsors: A.E. Johnston, D.B. Slope.

The 32nd year, old grass, leys, s. oats, potatoes, sugar beet, s. beans, s. barley, w. wheat.

For previous years see 'Details' 1967 & 1973 and 74-79/R/RN/1&2.

The experiment is duplicated on:-

HIGHFIELD — A site with much organic matter initially (ploughed out from permanent grass) (80/R/RN/1)

FOSTERS — A site with little organic matter initially (80/R/RN/2)

ROTATION — Treatments: The experiment originally tested four six-course rotations, with all phases present each year. In recent years these rotations were:-

	Treatment crops	Test crops
LUCERNE	LU, LU, LU	W, P, B
CLOGRA	LC, LC, LC	W, P, B
GRASS	LN, LN, LN,	W, P, B
ARABLE	H, SB, O,	W, P, B

LU = lucerne, LC = clover-grass ley, no nitrogen fertiliser, LN = all-grass ley with much nitrogen fertiliser, H = 1-year seeds hay, SB = sugar beet, O = s. oats, W = w. wheat, P = potatoes, B = s. barley.

From 1968 the order of test crops was changed to P, W, B except for those phases that had already started the sequence W, P, B.

From 1975 the s. barley test crop was changed to w. wheat.

RESEEDED — On both fields in the first three years other plots were sown with long-term reseeded grass

OLDGRASS — On Highfield plots of the old turf were left initially unploughed, for comparison with the three-year leys

In 1962 and 1963 some of the old and reseeded grass plots were divided for management identical to:-

C — Clover-grass ley
N — All-grass ley

https://doi.org/10.23637/ERADOC-1-31

80/R/RN/1 and 80/R/RN/2

From 1963 (reseeded) and 1968 (old grass) some grass plots were ploughed and cropped with the same test crops as above, thereafter these plots followed the ARABLE rotation. In 1973 some of these plots were returned to reseeded grass.

From 1968 only two phases on each field continued in the original six-course rotation (the museum blocks). The four other phases (the new sequence blocks) were sown to w. wheat every year at the end of the test-crop cycle. In 1977, 1978, 1979 and 1980 one phase, fallowed in the previous year started new sequences of treatment cropping:

SEQUENCE		Treatment crops	Test crops
LUCERNE	(previously LUCERNE)	LU, LU, LU	W, W, W, W
CLOGRA	(previously CLOGRA)	LC, LC, LC	W, W, W, W
GRASS/G	(previously GRASS)	R, R, R	W, W, W, W
ARABLE/A	(previously ARABLE)	O, P, BE	W, W, W, W
ARABLE/R	(previously RESEEDED)	B, B, W	W, W, W, W
GRASS/OG	(previously OLDGRASS)	R, R, R	W, W, W, W

R = ryegrass, BE = s. beans. Other symbols as above. All ploughed at the end of the treatment crop cycle except GRASS/OG - direct drilled to w. wheat. Treatment crop cycles start after nine previous cereals followed by one fallow. In treatment years yields are taken only from s. barley and w. wheat.

LEY/ARABLE

Object: To compare the effects on soil fertility of rotations with or without leys - Woburn Stackyard D.

Sponsors: A.E. Johnston, G.A. Salt.

The 43rd year, leys, s. barley, s. oats, w. wheat.

For previous years see 'Details' 1967 & 1973 and 74-79/W/RN/3.

Design: 5 series of 8 plots, split for treatments other than rotations.

Whole plot dimensions: 8.53 x 40.7.

Treatments: All phases of four five-course rotations were originally present:

ROTATION

LEY	Clover/grass ley:	L, L, L, P, W
CLO	All legume ley:	SA, SA, SA, P, W until 1971 then CL, CL, CL, P, W
A	Arable with roots:	P, R, C, P, W until 1971 then P, B, B, P, W
A H	Arable with hay:	P, R, H, P, W until 1971 then P, B, H, P, W

P = potatoes, R = w. rye, C = carrots, W = w. wheat, B = s. barley, H = hay, L = clover/grass ley, SA = sainfoin ley, CL = red clover ley

Rotations themselves followed different cycles:

On four plots in each block the rotations were repeated

On four plots in each block arable rotations alternated each five years with ley rotations (ALT)

From 1976 all the rotations were changed on all phases except for the first and second test crops in 1976:

LN 3	(Previous LEY) LN, LN, LN, W, B
LC 3	(Previous CLO) LC, LC, LC, W, B
AF	(Previous A) F, F, O, W, B
AB	(Previous A H) B, B, O, W, B

LN = grass ley with N, LC = clover/grass ley no N, O = oats, F = fallow

Plots hitherto in alternating rotations were changed to test eight-year leys:

ALT LN	LN, LN, LN, LN, LN, LN, LN, LN, W, B
ALT LC	LC, LC, LC, LC, LC, LC, LC, LC, W, B

https://doi.org/10.23637/ERADOC-1-31

The new scheme started by sowing these new leys in spring 1976 on four phases and in spring 1977 on the fifth phase (2nd test crop in 1976). Initially some of the long term leys are ploughed up in less than eight years ALT LN, ALT LC, depending on the starting point in relation to the test crop, to ensure that ultimately eight-year leys will be available for each test crop period.

Yields are taken only from the test crops.

RESIDUAL PHOSPHATE

Object: Originally to study the fresh and residual effects of phosphate fertiliser on the yields of three arable crops grown in rotation. From 1974 the effects on ley and on yield and pathogens of continuous w. wheat were studied. In 1980 only ley was included - Great Field IV and Sawyers I.

Sponsors: G.E.G. Mattingly.

The 21st year, ley.

For previous years see 'Details' 1967 and 1973 and 74-79/R/RN/7.

Design: Great Field IV: 3 series each of 1 randomised block of 12 plots.
Sawyers I: 3 series each of 2 randomised blocks of 12 plots.

Whole plot dimensions:
Great Field IV: 4.27 x 18.3
Sawyers I: 4.27 x 20.1

Treatments:

376 S(1)	376 as granular superphosphate

NOTES: (1) From 1974 the original rotation of potatoes, s. barley, swedes on both fields was changed. Blocks after barley were sown to w.wheat on Sawyers I, to ley on Great Field IV. In 1978 & 1979 one series was sown to ley each year on Sawyers I. In 1980 the remaining series on Sawyers I was fallowed.
(2) Since 1960 all phosphate has been applied as superphosphate.
(3) The six-yearly dressings were applied half in autumn before ploughing, half in spring.

ORGANIC MANURING

Object: To study, from crop yields and soil analyses, the residual effects of a range of types of organic matter - Woburn, Stackyard B.

Sponsor: G.E.G. Mattingly.

The 16th year, s. barley, sugar beet, ley.

For previous years see 'Details' 1973 and 74-79/W/RN/12.

Whole plot dimensions: 8.53 x 30.5.

Treatments: From 1966 to 1971 the experiment had a preliminary period designed to build up organic matter, derived from different sources. An arable rotation was started on two blocks in 1972 and the remaining two blocks in 1973. Organic manures were last applied in 1971, the leys were ploughed in autumn 1971 and 1972 before starting the rotation. The experiment now tests all combinations of:-

Whole plots

1. MANURE — Organic manures and fertilisers in the preliminary period:

FYM	Farmyard manure
STRAW	Straw
FERT-FYM	Fertilisers equivalent to FYM
FERT-STR	Fertilisers equivalent to straw
CLOVRLEY	Clover/grass ley, no N
GRASSLEY	Grass ley with N for each cut

Sub plots

30	40
60	80
90	120

Two additional MANURE treatments given green manures (GREENMNR) and peat (PEAT) in the preliminary period have been sown to clover/grass ley - 2 blocks in 1979 and 2 blocks in 1980.

EFFECTS OF DEEP PK

Object: To study the residual effects of subsoiling and of incorporating a large dressing of PK in either the subsoil or topsoil, on yields and nutrient uptakes of s. barley - Woburn Butt Furlong.

Sponsor: J. McEwen.

The seventh year, s. barley.

For previous years see 74-79/W/RN/16.

Design: 4 series of 3 randomised blocks of 4 plots with PREVCROP on series.

Whole plot dimensions: 4.27 x 2.59.

Treatments: All combinations of:-

Series

1. PREVCROP — Previous cropping (1974-1977) (all in barley 1978 & 1979):

P B B	W. wheat, sugar beet, s. barley, potatoes
W B B	Sugar beet, s. barley, potatoes, w. wheat
S B B	S. barley, potatoes, w. wheat, sugar beet
B B B	Potatoes, w. wheat, sugar beet, s. barley

Plots

2. PK SUB — Extra PK and subsoil treatment (applied autumn 1973):

	Extra PK	Subsoil (25-50 cm) treatment
- - -	None	None
- - S	None	Subsoiled
P K T	To topsoil (0-25 cm)	None
P K S	To subsoil	Subsoiled

NOTES: (1) The rates of P and K were 1930 kg P205, as superphosphate and 460 kg K20 as muriate of potash. These quantities, applied to subsoil, were chosen to equalize available P and K in top and subsoil.
(2) Subsoiling was done by spade, after removing the topsoil which was then replaced. PK to subsoil was worked in by forking.
(3) PK to topsoil was applied half before ploughing in autumn half soon after on the plough furrow.

Basal applications: Manures: All Series: Magnesian limestone at 2.5 t; (20:10:10) at 540 kg, combine drilled. Weedkillers: Mecoprop, bromoxynil and ioxynil ('Brittox' 3.5 l in 280 l). Fungicide: Tridemorph ('Beacon' 0.7 l in 280 l).

Seed: Georgie, dressed with ethirimol, sown at 160 kg.

https://doi.org/10.23637/ERADOC-1-31 *pp 97*

80/W/RN/16

Cultivations, etc.:- Magnesian limestone applied: 31 Oct, 1979. Ploughed: 2 Nov. Spring-tine cultivated with crumbler attached, seed sown: 29 Feb, 1980. Weedkiller applied: 25 Apr. Fungicide applied: 13 May. Harvested by hand: 7 Aug.

NOTE: N, P, K, Na, Ca and Mg contents of grain were measured.

Object: To study the effects of a range of nematicides on incidence of Globodera rostochiensis and yield of potatoes. Residual effects of previous treatments are studied in wheat and barley - Woburn Great Hill II and III.

Sponsor: A.G. Whitehead.

The 11th year, potatoes, s. barley.

For previous years see 71/W/CS/34(t), 72/W/CS/34(t) and 73-79/W/CS/34.

Design: 4 series of 3 blocks of 10 plots.

Whole plot dimensions: 4.27 x 9.14.

Potatoes (Series III): Manures: (13:13:20) at 1880 kg. Weedkiller: Linuron at 1.1 l in 280 l. Fungicide: Mancozeb at 1.3 kg in 300 l applied on five occasions, with insecticide on the first, third, fourth and fifth occasions. Insecticide: Pirimicarb at 0.14 kg. Haulm desiccant: Undiluted BOV at 170 l.

Seed: S. barley: Georgie, dressed with ethirimol, sown at 160 kg.
W. wheat: Flanders, sown at 190 kg.
Potatoes: Pentland Crown.

Cultivations, etc.:-
S. barley (Series I): Ploughed: 8 Nov, 1979. Heavy spring-tine cultivated: 29 Feb, 1980. Spring-tine cultivated with crumbler attached: 3 Mar. Seed sown: 4 Mar. Spring-tine cultivated, seed resown without fertiliser because of erosion damage: 14 Apr. Weedkillers and fungicide applied: 16 May. Combine harvested: 28 Aug.
W. wheat (Series II): Magnesian limestone applied: 31 Oct, 1979. Ploughed, spring-tine cultivated with crumbler attached. Seed sown: 13 Nov. N applied: 9 Apr, 1980. Weedkillers applied: 15 Apr. Combine harvested: 26 Aug.
Potatoes (Series III): Heavy spring-tine cultivated: 25 Oct, 1979; 18 Feb, 1980. NPK applied: 12 Apr. Heavy spring-tine cultivated: 14 Apr. Aldicarb and oxamyl applied, rotary cultivated: 29 Apr. Potatoes planted: 30 Apr. Weedkiller applied: 16 May. Grubbed: 11 June. Earthed up: 12 June. Fungicide applied: 18 June, 3 July, 22 July, 10 Aug, 22 Aug. Insecticide applied: 18 June, 22 July, 10 Aug, 22 Aug. Haulm mechanically destroyed: 22 Sept. Desiccant applied: 24 Sept. Lifted: 1 Oct.

NOTES: (1) Soil samples were taken before treatments were applied and after harvest for cyst and egg counts of Globodera rostochiensis.
(2) Because of soil erosion damage the yields of s. barley (Series I) were not taken. For the same reason the yields of seven plots of wheat Series II were lost. Two of RATE NONE and those with treatment combinations:

S NEM(79)	ALDICARB	OXAMYL	ALDICARB	OXAMYL	OXAMYL
SNEMRATE	2.5	2.5	2.5	2.5	7.5

(3) Because of an error at weighing the yields of two plots of potatoes Series III were lost. Both were with the combination S NEM(80) ALDICARB and SNEMRATE 7.5.

Sponsors: A.J. Barnard, D. Hornby.

The tenth year, forage maize.

For previous years see 71/W/CS/66(t), 72/W/CS/66(t) and 73-79/W/CS/66.

Design: 4 blocks of 2 plots split into 4.

Whole plot dimensions: 2.13 x 16.5.

Treatments: All combinations of:-

	100	100 to seedbed
	150	150 to seedbed
	50+100	100 to seedbed, 50 two weeks before sowing (before 1978 this treatment received 100 to seedbed, 50 five weeks after emergence)

Basal applications: Manures: Magnesian limestone at 2.5 t, (0:14:28) at 630 kg. Weedkiller: Atrazine at 1.1 l in 280 l.

Seed: Fronica, sown at 103,300 seeds per hectare.

Cultivations, etc.:- Magnesian limestone applied: 31 Oct, 1979. Ploughed, spring-tine cultivated: 2 Nov. Heavy spring-tine cultivated: 29 Feb, 1980. Spring-tine cultivated with crumbler attached: 7 Apr. Early N and PK applied: 16 Apr. Weedkiller applied, and harrowed in, seed sown: 30 Apr. Seedbed N applied: 1 May. Hand harvested: 6 Oct.

NOTES: (1) Soil samples were taken in July and after harvest for counts of ectoparasitic nematodes.
(2) Counts were made of common smut (Ustilago maydis) and stalk rots (Fusarium spp.).
(3) Because of poor germination, yields from 2 subplots were lost, one DAZOMET 0, N 50 + 100 the other DAZOMET 450, N 150. Estimated values were used in the analysis.

SOWING DATES AND CCN

Object: To study the residual effects of sowing date, a nematicide, a soil sterilant and previous cropping on the incidence of cereal cyst-nematode (Heterodera avenae) (CCN) and on the yield of s. oats in a soil known to contain a fungal parasite of the nematode - Woburn, Butt Close.

Sponsor: B.R. Kerry.

The sixth year, s. oats.

For previous years see 75/W/M/1 and 76-79/W/CS/174.

Design: Single replicate of 36 plots split into 2.

Whole plot dimensions: 2.13 x 6.70.

Treatments: All combinations of:-

Whole plots

	WHEAT	
	BARLEY	
	OATS	
2.	SOW DATE(76)	Sowing date (cumulative 1975-76):

Basal applications: Manures: (20:10:10) at 400 kg, combine drilled. Weedkillers: Mecoprop, bromoxynil and ioxynil ('Brittox' at 3.5 l in 280 l) applied twice, with fungicide on the second occasion. Fungicide: Tridemorph at 0.53 kg. Irrigation (mm water):

12 June	20
23 July	10
Total	30

Seed: Manod, sown at 170 kg.

Cultivations, etc.:- Ploughed: 5 Nov, 1979. Heavy spring-tine cultivated: 28 Feb, 1980. Spring-tine cultivated with crumbler attached, seed sown: 24 Mar. Missing rows resown, by hand: 17 Apr. Weedkillers applied: 25 Apr, 13 May. Fungicide applied: 13 May. Combine harvested: 27 Aug.

EFFECTS OF PHIALOPHORA

Object: To study the effects of ryegrass, oats and wheat, and of soil inoculation on populations of Phialophora radicicola graminicola (Prg) and on take-all (Gauemannomyces graminis) and yield of following w. wheat crops - Whittlocks.

Sponsors: E. Lester, D.B. Slope, R.J. Gutteridge.

The fourth year, w. wheat.

For previous years see 77-79/R/CS/202.

Design: 3 randomised blocks of 8 plots.

Whole plot dimensions: 2.67 x 6.10.

Treatments:

CRP INOC	Crops in 1977 (all w. wheat 1978 to 1980) and inoculation in 1977 and 1978:
GRASS	Ryegrass
GRASS(I)	Ryegrass + Prg inoculum 1977
OATS	S. oats
OATS(I)	S. oats + Prg inoculum 1977
OATS I	S. oats + Prg inoculum to 1978 wheat
OATS DI	S. oats + dummy inoculum (sand) to 1978 wheat
WHEAT	S. wheat
WHEAT(I)	S. wheat + Prg inoculum 1977

NOTE: Phialophora inoculum was a culture macerated in coarse sand. Coarse sand alone was applied as dummy inoculum.

Basal applications: Manures: (0:20:20) at 260 kg, combine drilled. 'Nitro-chalk' at 480 kg. Weedkillers: Methabenzthiazuron at 3.1 kg in 220 l. Mecoprop with bromoxynil and ioxynil (as 'Brittox' at 3.5 l) in 250 l. Insecticide: Demeton-s-methyl at 0.24 kg in 250 l.

Seed: Flanders, sown at 200 kg.

Cultivations, etc.:- Ploughed: 19 Sept, 1979. Rotary harrowed: 6 Oct. Seed sown, methabenzthiazuron applied: 8 Oct. N applied: 11 Apr, 1980. 'Brittox' applied: 24 Apr. Insecticide applied: 24 June. Combine harvested: 21 Aug.

NOTE: Estimates of take-all and Phialophora were made on the crop in April and early July. Bio-assays of soils for take-all and Phialophora were made after harvest, before ploughing.

EFFECTS OF SUBSOILING & DEEP PK

Object: To study the effects of subsoiling and of incorporating a large dressing of PK in the subsoil on yields and nutrient uptakes of a sequence of crops - Rothamsted (R) Delharding and Woburn (W) Road Piece.

Sponsors: J. McEwen, A.E. Johnston (R), M.K.V. Carr, R.J. Godwin (National College of Agricultural Engineering), P.T. Gooderham, I.B. Warboys, J.M. Wilkes (Wye College).

The third year, s. barley.

For previous years see 78-79/R&W/CS/216.

Design: 3 randomised blocks of 6 plots.

Whole plot dimensions: 4.27 x 13.7.

Treatments:

TREATMNT	Machines and incorporation of extra P and K into the subsoil:
OOO OO	Not subsoiled, no P or K
FOO FO	Farm standard, unwinged, subsoiler, no P or K, autumn 1977 & autumn 1979
NOO NO	N.C.A.E. winged subsoiler, no P or K, autumn 1977 & autumn 1979
NPK NO	N.C.A.E. winged subsoiler, P and K applied autumn 1977, subsoiled only autumn 1979
WOO OO	Wye double digger, no P or K, autumn 1977 only
WPK OO	Wye double digger, P and K applied, autumn 1977 only

NOTES: (1) The rates of P and K were 1930 kg P_2O_5, as triple superphosphate and 460 kg K_2O as muriate of potash.

(2) In autumn 1977 the Farm standard, unwinged, subsoiler was set to work at a depth of 38 cm at intervals of 50 cm Delharding (R) and at a depth of 50 cm at intervals of 70 cm Road Piece (W). In autumn 1979 it was set to work at a depth of 56 cm at intervals of 76 cm Delharding (R) and 142 cm Road Piece (W).

(3) In autumn 1977 the N.C.A.E. winged subsoiler had a single tine set to work at a depth of 40 cm at intervals of 60 cm on plots not given P and K and at alternate depths of 30 cm and 40 cm spaced 30 cm apart on plots given P and K; fertiliser was applied behind the subsoiling points. In autumn 1979 the winged subsoiler had three tines, the centre tine preceding the others, all set to work at a depth of 40 cm spaced 40 cm apart.

(4) The Wye double digger turned a furrow with a conventional plough to a depth of 23 cm and at the same time rotary cultivated the bottom of the furrow to a further depth of 15 cm. When applying P & K this was distributed ahead of the rotary cultivator.

The crop failed and was replaced by s. barley. Yields of the s. barley showed no effects from treatments applied to the 1980 crop of w. oilseed rape and these have been ignored in the analysis presented.

Sponsors: D.P. Stribley, P.B. Tinker.

The second year, potatoes.

For previous year see 79/R/CS/240.

Design: Single replicate of 24 plots.

Whole plot dimensions: 2.84 x 3.35.

Treatments: All combinations of:-

1. INOCULUM — Mycorrhizal inocula:

NONE	None in 1979 & 1980
G MOSSE	Glomus mosseae in 1979 & 1980
G CALED	Glomus caledonius in 1980, Gigaspora sp. in 1979

NOTES: (1) Leeks planted after potatoes in 1979 established and grew poorly. No treatment gave a yield greater than 0.1 tonnes and yields are not reported.
(2) Four extra plots, used for tests on close-planted potatoes in 1979, were used in 1980 for tests on maize, yields were not taken.
(3) Inoculum was prepared by growing leeks in pots of soil suitably infected with the mycorrhiza. After 20 weeks growth, soil and roots in the pots were chopped and applied to the potatoes at 0.5 kg per tuber. Uninoculated plots received soil and roots at the same rate from pots growing uninfected leeks.

Standard applications:
Leeks: Manures: N at 180 kg, K_2O at 115 kg as (25:0:16).
Potatoes and Maize: Manures: N at 160 kg, as 'Nitro-Chalk', K_2O at 300 kg, as muriate of potash, Mg at 5 kg, as Epsom salts.
Weedkillers: Linuron at 1.0 kg plus paraquat at 0.28 kg ion in 280 l.
Fungicide: Mancozeb at 1.3 kg in 280 l, applied twice, with the insecticide. Insecticide: Pirimicarb at 0.14 kg. Irrigation: 25 mm of water.

Seed: Potatoes: Pentland Crown.
Maize: Fronica.

NOTE: Measurements were made of plant and shoot numbers, dry weight of tops and ears, leaf areas and N, P and K content three times during growing season. Weekly measurements were made for soil moisture and plant moisture stress (between April and harvest). Disease assessments were made during the growing season. Soil samples were taken in autumn and spring before fertiliser application to determine their N content.

RHYNCHOSPORIUM CONTROL IN A SERIALLY BALANCED DESIGN

Object: To study the effects of interference between plots of w. barley with different amounts of Rhynchosporium secalis - Gt. Knott III.

Sponsors: J.F. Jenkyn, A. Bainbridge, G.V. Dyke.

Design: 2 lines of 38 plots each. Each line is a serially balanced sequence such that each of 4 treatments has as neighbours all ordered pairs of the other 3 treatments, once each.

Whole plot dimensions: 3.9 x 9.14.

Treatments:

TREATMNT	Treatment with infected straw and times of applying fungicide:
0 INFSTR	No fungicide against R. secalis. Infected straw worked in to seedbed
CAPT A	Captafol in autumn
CAPT S	Captafol in spring
CAPT A+S	Captafol in autumn and in spring

NOTES: (1) The effects of treatments to neighbouring plots (left - LHN, right - RHN) are estimated. In this experiment 'left' was South, 'right' was North. The analysis presented assumes a Fourier curve with 4 terms, 2 sine and 2 cosine to represent positional variation.

(2) The area surrounding this experiment was sown with the Rhynchosporium resistant variety Athene at 160 kg on 18 Oct, 1979.

(3) Straw was applied (at 645 kg) to '0 INFSTR' plots on 17 Oct, 1979.
Captafol was applied at 1.34 kg in 340 l on 31 Dec and 10 Apr, 1980.

Basal applications: Manures: (10:23:23) at 250 kg, combine drilled. 'Nitro-chalk' at 540 kg. Weedkillers: Paraquat at 0.56 kg ion in 220 l. Methabenzthiazuron at 1.6 kg in 220 l. Fungicide: Ethirimol (as 'Milgo E' at 1.3 l) in 220 l.

Seed: Maris Otter, sown at 160 kg.

Cultivations, etc.:- Heavy spring-tine cultivated: 25 Sept, 1979. Paraquat applied: 15 Oct. Power harrowed: 17 Oct. Seed sown: 18 Oct. Methabenzthiazuron applied: 20 Oct. Fungicide applied: 5 Apr, 1980. N applied: 9 Apr. Combine harvested: 31 July. Previous crops: S. barley 1978, w. oats 1979.

NOTE: Leaf diseases were assessed during the season, and 1000 grain weights after harvest.

50	60
75	90
100	120
125	150

NOTE: Ark Royal was sown at 140 kg and Porthos at 160 kg. These seed rates each gave 350 seeds per square metre.

Basal applications:
Delafield (R): Manures: (0:20:20) at 310 kg. Weedkillers: Dicamba with mecoprop and MCPA ('Banlene Plus' at 5.0 l) in 250 l applied with the fungicide. Fungicide: Tridemorph at 0.53 kg.
Lansome III (W): Manures: FYM at 50 t, (0:20:20) at 310 kg. Weedkillers Mecoprop with bromoxynil and ioxynil ('Brittox' at 3.5 l) in 280 l applied with the tridemorph. Fungicides: Tridemorph at 0.53 kg; triadimefon 0.13 kg in 220 l applied with the insecticide. Insecticide: Demeton-s-methyl at 0.24 l.

Cultivations, etc.:-
Delafield (R): Subsoiled, tines 160 cm apart and 40 cm deep: 12 Nov, 1979. Chisel ploughed twice: 3 Dec, 4 Dec. Spring-tine cultivated: 6 Apr, 1980. PK and N applied: 7 Apr. 80/R/B/8 and 80/W/B/8

Lansome III (W): Subsoiled, tines 140 cm apart and 50 cm deep: 12 Aug, 1979. FYM applied, ploughed: 21 Aug. Heavy spring-tine cultivated: 29 Feb, 1980. PK applied: 13 Mar. Heavy spring-tine cultivated: 4 Apr. N applied, spring-tine cultivated with crumbler attached: 5 Apr. Seed sown: 10 Apr. Weedkiller with tridemorph applied: 30 May. Triadimefon with insecticide applied: 3 July. Combine harvested: 28 Aug. Previous crops: S. barley 1978, grass 1979.

NOTES: (1) Plant populations were counted at Rothamsted and Woburn and crop cover and growth were assessed at Woburn.
(2) Because of rabbit damage the yield from one plot at Rothamsted was lost with treatment combination, VARIETY ARKROYAL N 50. An estimated value was used in the analysis.

PRECISION SOWING

Object: To study the effects of precision sowing and four seed rates on the yield of s. beans - Summerdells I.

Sponsor: J. McEwen.

Design: 3 blocks of 8 plots, randomisation restricted.

Whole plot dimensions: STANDARD : 4.27 x 8.23
PRECISION : 3.25 x 8.23

Treatments: All combinations of:-

1. DRILL — Drills and spacing between rows:

   STANDARD — Standard farm drill sowing seed irregularly in rows 18 cm (7 ins) apart
   PRECISN — Stanhay precision drill sowing seed evenly-spaced in rows 20 cm (8 ins) apart

2. POPULATN — Plant populations in thousands per hectare:

	Target population	Population achieved	
		STANDARD	PRECISN
3	300	149	251
4	400	250	314
5	500	285	301
6	600	359	322

NOTES: (1) All populations achieved were substantially less than intended. The precision drill gave very small differences between populations achieved.
(2) Centres of plots were damaged by wheelings. Yields and figures for populations achieved were taken from an undamaged strip, three to five rows wide, from one side of each plot excluding the two outer rows.

Basal applications: Manures: Chalk at 7.5 t. Weedkillers: Trietazine with simazine (as 'Remtal SC' at 2.5 l) in 250 l. Insecticide: Permethrin at 0.10 kg in 340 l.

Seed: Minden.

Cultivations, etc.:- Chalk applied: 9 Oct, 1979. Ploughed: 30 Oct. Rotary harrowed, seed sown: 5 Mar, 1980. Weedkillers applied: 21 Mar. Insecticide applied: 23 Apr. Combine harvested: 18 Sept. Previous crops: S. barley 1978 and 1979.

NOTE: Components of yield were measured at maturity.

plus one extra treatment (three plots per block):

EXTRA	
NONE	No fungicides

Basal applications: Manures: (13.13.20) at 380 kg. 'Nitro-Chalk' at 750 kg. Weedkillers: Dalapon at 0.95 kg with propyzamide at 0.70 kg in 220 l. 3, 6-Dichloropicolinic acid with benazolin ('Benazolox' at 1.0 kg) in 250 l. Desiccant: Diquat at 0.56 kg ion in 220 l.

Seed: Primor, dressed with gamma HCH. Benomyl and thiram, sown at 9 kg.

Cultivations, etc.:- NPK applied, heavy spring-tine harrowed twice: 10 Sept, 1979. Chisel ploughed, rotary harrowed, seed sown, 11 Sept. Dalapon and propyzamide applied: 2 Nov. N applied: 20 Feb, 1980. 'Benazolox' applied: 29 Feb. Desiccant applied: 25 July. Hand harvested: 23 July. Previous crops: Winter oilseed rape 1978 and 1979.

NOTES: (1) The crop was damaged by sparrows shortly before maturity and despite hand harvesting the grain yields presented reflect considerable loss from this cause. Straw yields were not affected and are presented as better indicators of the effects of treatments on crop growth.
(2) Growth and disease assessments were made monthly from March until harvest.

Whole plot dimensions: 1.83 x 22.9.

Treatments: All combinations of:-

Whole plots

1. VARIETY	Varieties:	
SEAFARER	Seafarer, harvested as grain	
CASCADE	Cascade, harvested as green pods	
2. INOCULUM	Inoculum:	
NONE	None	
RHIZOB	Rhizobium phaseoli - a mixture of strains, R3644, R3622 and 963A	

Sub plots

3. N	Nitrogen fertiliser (kg N) as 'Nitro-Chalk':
0	None
30	30 to seedbed
60	60 to seedbed
120	120 to seedbed
120+60	120 to seedbed plus 60 at flowering

plus two extra plots:

EXTRA	
SEAF ISN	Seafarer, inoculated R. phaseoli and given slow release N
CASC ISN	Cascade, inoculated R. phaseoli and given slow release N

NOTES (1) The slow release N was a mixture of glucose and ammonium sulphate labelled with 15 N in the ratio 10:1 and applied at 1 kg N.
(2) In each block there was one plot divided into sub plots for crops (maize, fenugreek and soya bean) and nitrogen fertiliser applied at the same rates given to Phaseolus, to assess N uptake by non-nodulating crops during the season. Yields from these crops are not presented.
(3) One of the blocks was abandoned because of many grass weeds.
(4) Yields were not recorded for VARIETY CASCADE and EXTRA SEAF ISN.
