SEED RATES AND SOWING DATES

**Object:** To define the optimum crop structure for DETN 20, a model genotype of the dwarf determinate plant type - Highfield IV/Road Piece East.

**Sponsors:** I.F. Shield, H.J. Stevenson, J.E. Leach, T. Scott.

**Design:** 4 randomised blocks of 2 x 4 + 4.

**Plot dimensions:** 9.0 x 9.0.

**Treatments:** All combinations of:-

1. **SOW DATE**                      Sowing date:

L                                      22-Sep-99

2. **SEED RATE**                      Seeds per m<sup>2</sup>:

R1                                      20  
R2                                      40  
R3                                      60  
R4                                      80

**EXTRA**                                  All sown at 40 seeds/m<sup>2</sup>:

EIR                                      Early sown, irrigated  
ESH                                      Early sown, shaded  
LIR                                      Late sown, irrigated

**Experimental diary:**

04-Jul-00 : B : : tm)Aphox at 280 g in 200 l.  
 : B : : tm)Enhance Low Foam at 50 ml in 200 l.  
 22-Aug-00 : T : ESH,LSH : Shading removed.  
 27-Sep-00 : B : : Combine harvested.

Previous crops: W. barley and w. wheat 1998, 1999.

- NOTES:** (1) Five plots were lost, one with treatment combination **SOW DATE** L and **SEED RATE** R1 because soil had been imported to fill a dell and one of each of the 4 **EXTRA** treatments were not applied. Estimated values were used in the analysis.
- (2) Radiation interception was measured weekly through the growing season. Supplementary red light was applied to parts of three plots during flowering and pod filling. Leaf and pod photosynthesis was measured. Radiation spectral measurements also measured occasionally. Dry matter and partitioning was measured every three weeks. Pods were counted weekly from flowering to harvest. Pod and seeds were weighed weekly during maturation. Components of yield were assessed at harvest.
