VARIETIES, N AND CCC

Object: To study the effects of nitrogen fertiliser, at a range of rates and times, and chlormequat (CCC) on the yield of two varieties of winter wheat - Saxmundham, Oldershaw's and Garner's plots.

Sponsors: F.V. Widdowson, A.E. Johnston.

The ninth year, winter wheat.

For previous years see 66/C/30(t), 67/C/23(t), 68/C/39, 69-70/S/CS/1, 71/S/CS/1(t), 72/S/CS/1(t) and 73/S/CS/1.

Design: A single replicate of 4 x 2 x 2 x 2 in 4 blocks of 4 plots, each split lengthways into 2, plus one additional plot per block. Additionally all the plots are split breadthways into 3.

Whole plot dimensions: 5.49 x 40.2. Sub-plot area harvested: 0.00355.

Treatments: All combinations of:Whole plots (All sown at a seed rate of 170 kg with 13 cm (5 inches)

Basal applications: Manures: 1260 kg (0:20:20) applied to stubble before ploughing. 31 kg P205 and K20 broadcast at drilling as (20:10:10) except extra plots receiving no autumn N which received (0:20:20). Weedkillers: Terbutryne and related triazines ('Prebane' at 4.5 kg in 340 l&, Ioxynil at 0.63 kg with mecoprop at 1.9 kg in 450 l.

Cultivations, etc.:- First basal PK applied: 19 Sept, 1973. Ploughed: 25 Sept. Spring-time cultivated: 3 Oct. Seed sown and second basal PK applied: 4 Oct. 'Prebane' applied: 5 Oct. Toxynil and mecoprop applied: 2 Apr, 1974. Growth regulator applied: 7 May. Combine harvested: 28 Aug.

NOTE: Green crop samples were taken for estimates of total dry matter and leaf areas.

were badly damaged by birds and no yields were taken. Estimated values were used in the analysis.

(2) On the EXTRA plots one of the whole plots receiving CCC was waterlogged and infested with blackgrass causing a decrease in plant population.
